inous estates thus amassed were brought to a high state of cultivation. The railroads of Egypt were greatly extended, the cultivation of sugar was introduced on the Khedive's estates at enormous expense, and the canals were improved and multiplied. Ports were made at Alexandria and Suez. Ismail also built many sumptuous palaces, maintained a superb opera and ballet, and feasted and entertained every person that visited Egypt. Every European speculator that started an enterprise in Egypt could rely on the financial aid of the Khedive if he found himself pecuniarily embarrassed. When Ismail ascended the throne he found that Ferdinand de Lesseps had secured concessions that were embarrassing and dangerous to the state. To rectify his predecessor's mistake he was willing to pay heavily, and he generously referred the question of compensation to Napoleon III, who fixed the award at 100,000,000 francs. The Khedive foresaw the political danger that the building of the Suez Canal involved. If he could have done so safely, he would have canceled the concession; but since he could not withdraw, he worked zealously to make the canal a success, relying on the friendship of the French to avert evil consequences, and this friendship he endeavored always to retain, at the cost of heavy pecuniary sacrifices. Ismail Pasha, after obtaining in 1866 the title of Khedive-Misr, a recognition of sovereignty, increased his army and acquired a fleet. But this excited the jealousy of the Porte, which, in 1870, with the support of the great powers, required him to deliver up the armor-clads. In 1868, when Ismail was received as a fellow-sovereign at the European courts, and afterward entertained, with regal pomp and splendor, the French Empress and the Prussian Crown Prince at the opening of the Suez Canal, he reached the zenith of his glory, but not the summit of his ambition. In 1873 he distributed an immense sum in bribes among the dignitaries of Stamboul, to obtain a new firman, which transformed Egypt into a practically independent tributary state, requiring only an acknowledgment of the suzerainty of the Sultan and military aid in case of war. He then set about the subjugation of the Soudan, conquering Darfur in 1874, but failing in a campaign against Abyssinia. Ismail and Egypt were already embarrassed in their finances. From the first the international money lenders had him in their power. With railroads, harbors, irrigation works, sugar mills, armaments, and palaces half finished, and innumerable industrial enterprises under way, for which he had made himself responsible, he could only keep things going by submitting to extortionate terms, issuing bonds for which he received only a fraction of their face value, and renewing loans with others of longer term, with 25 per cent. compound interest added. The productive and taxpaying powers of the country increased with remarkable rapidity, owing to his improvements, but did not keep pace with the debts that were thus multiplied on paper without any equivalent consideration being given. In 1875 the Khedive was compelled to sell to the British Government for £4,000,000, with which to meet immediate obligations, his 177,000 shares in the Suez Canal. In 1876 default was made in the debt of the Daira Sanieh estate. Ismail appealed to his creditors to save the national resources from wreck, and was willing to sacrifice his individual interests. Gischén and Joubert went to Egypt as representatives of the English and French bondholders, and worked out a plan of financial reform to which the Khedive agreed. Another English financial expert, Rivers Wilson, having induced Ismail to convey to the state all his private estates, assumed charge of the Ministry of Finance with Nubar Pasha, while M. de Blignières took hold of the Public Works Department. In consequence of this a military revolt broke out Feb. 18, 1879, and Ismail, who was suspected of complicity in the insurrection, carried out a coup d'état in April by summoning a Chamber of Notables, before which he laid a scheme of reform that would have entailed the dismissal of the European

ministers while preserving the dual control. The great powers thereupon, through their consul generals, demanded the abdication of Ismail Pasha. He refused to resign at their bidding, but submitted to be formally deposed by his suzerain, when the Porte, under pressure from England and France, was induced to issue the decree. On June 26, 1879, Ismail Pasha formally abdicated in favor of his son Tewfik, and on July 1 he left his country forever. He sailed for Constantinople, but was forbidden to land there. He lived in Naples until politicians raised an outcry against his being allowed to keep a harem, and remained in Rome also a short time, and went in 1880 to Constantinople, where he spent most of the remainder of his life without holding any intercourse with the Sultan, and really interned by the Ottoman Government.

Krestowsky, M., a Russian novelist, born in the government of Kieff in 1820; died in Warsaw in February, 1895. He served in the Russian army as an officer of Uhlans, first in the line and afterward in the guard. During the Russo-Turkish War he was attached to the general staff as historiographer. Among the most esteemed novels, many of which have been translated into French, are: "Une Créature dévoyée, mens chère"; "The Sphinx"; "En voyage"; "Le Troupeau de Panurge"; "Sous les Châtaigniers"; "Le Diablotin"; "My Uncle Bujanoff"; and "Mme. Ridiueff."

Lauth, Franz Josef, a German Egyptologist, born in 1822; died in Munich, Feb. 11, 1895. From 1869 he was a professor in the University of Munich and conservator of the Egyptian collections. His most important published work was "Manetho und der Turiner Königspapyrus." He also wrote "Die Geburt der Minerva auf der Cospiarischen Schale"; "Das Germanische Runen-Fudark"; "Das Universal-Alphabet auf der Grundlage des hebraischen Systems"; "Les Zodiaques de Denderah"; "Moses der Ebräer, aus zwei Papyrusurkunden"; "The Historical Results of Egyptology"; "Aegyptische Chronologie"; "Homer und Aegypten"; "Aus Aegypten Vorzeit"; "Moses-Hosarsyphos-Salichus"; and "Die Pianchi-Stele."

Locker-Lampson, Frederick, an English poet, born in Greenwich in 1821; died in Rowfant, Sussex, May, 30, 1895. He was a son of Edward Hawke Locker, who founded the Naval Gallery at Greenwich Hospital, and was for some years *poète en titre* in the Admiralty. Among writers of *vers de société* he ranks among the first, standing in much the same relation to his own generation that Mackworth Praed stood to his. His touch is the lightest possible, and his humor never becomes flippant. Among his best poems are: "A Nice Correspondent," "At Her Window," "A Human Skull," "Little Dinkey," and "The Housemaid." It has been well said of him that "he has set small talk to music, and so adroitly that he never checks the flow of conversation." His first wife was a sister of the late Earl of Elgin, and his second wife a daughter of Sir Curtis Lampson. After the death of his father-in-law Mr. Locker added the name Lampson to his own. His published works include "London Lyrics" (1857; new edition, 1879); "Lyra Elegantiarum" (edited, 1867); "Patchwork" (1879).

Loven, Sven, a Swedish naturalist, born in Stockholm in 1809; died there Sept. 4, 1895. He was a son of the Mayor of Stockholm, and after taking his degree at Lund he went to Berlin and attended lectures on natural history. Returning to Sweden, he devoted himself to studying the maritime fauna of the coasts of countries bordering on the North Sea and the Baltic. He became a professor and conservator of the Museum of Natural History at Stockholm in 1841. Among his numerous scientific memoirs are the following: "O Evadne" (1835); "Campanularia and Syncoryne" (1836); "Evertbrate Animals" (1840-49); "Development of Lamellibranchiata" (1848); "Glacial Marine Crustacea" (1862); "Portalesia" (1873); "Echinoida" (1874);

"Species of Echinoclea described by Linnaeus" (1807); and "Echinomnidae" (1808).

Ludwig Karl, a German physiologist, born in Wittenburg in 1816; died in Leipzig, April 25, 1895. He was graduated as doctor in 1839, and became a privat docent in the University of Marburg in 1842. He was a professor at Zurich from 1849 till 1855, and then became professor in the Vienna Academy of Military Surgery. For the last thirty years he was Professor of Physiology at Leipzig. He brushed aside the transcendental theories that beclouded his science, and soon attracted students from all corners of the globe. His first published work was "Mechanism of Urine Secretion," explaining the formation of urine in the kidneys on purely mechanical principles. Prof. Ludwig invented the kymograph and other instruments for the graphic recording of physiological processes. He made important researches on the circulation of the blood, observing how this was influenced by respiration and acted upon by the medulla oblongata. He noted also the action of the nervous system as affecting glandular secretions. Important discoveries in pathology are due to him.

Lemby, Joseph Rawson, an English clergyman, born in Kilmington, Yorkshire; died in Grantechester, England, Nov. 21, 1895. He was one of the revisers of the Old Testament, and at the time of his death was Professor of Divinity at Cambridge. He was the author of "Early Dissent, Modern Dissent, and the Church of England" (1870); "A History of the Creeds" (1873); "A Popular Introduction of the New Testament" (1883); and "Greek Learning in the Western Church during the Seventh and Eighth Centuries."

Macduff, John Ross, a Scottish divine, born in Bonmahon, Perthshire, in 1818; died in Chislehurst, April 30, 1895. He was educated at the University in Edinburgh, and was ordained as minister of a parish in Forfarshire in 1843, whence he passed to a Perthshire parish in 1849, which he left to take charge of a new church in Glasgow. He preached there fifteen years, and then went to live in Kent and give himself up entirely to literary work. His best-known books are: "The Prophet of Fire"; "Memories of Bethany"; "Memories of Genosaret"; "The Shepherd and His Flock"; "Sunset on the Hebrew Mountains"; "Chasfort Ye"; "The Golden Gospel"; "Morning and Night Watches"; "The Bow in the Cloud"; "The Story of a Dewdrop"; and "The Story of a Star."

Malagola, Amleone, an Italian prelate, born in Modena, Dec. 24, 1840; died in Fermo, June 23, 1895. He entered the priesthood at an early age, became widely known for his eloquence and learning, rose to be Archbishop of Fermo, and was created a cardinal, Jan. 16, 1893.

Martha, Benjamin Constant, a French historian, born in Strasburg, June 4, 1830; died in Paris, May 28, 1895. He studied in the Ecole Normale, and became a professor at Strasburg in 1843, and in 1854 went to Douai as Professor of Ancient Literature, whence he was transferred to Paris, and became Professor of Latin Eloquence at the Sorbonne in 1863. He was chosen a member of the Academy of Moral Sciences in 1872. His most famous works were "Les Moralistes sous l'Empire Romain" and "Le Poème de Lucrèce," which were crowned by the Academy.

May, Mrs. Georgiana Marion Craik, an English novelist, born in London in 1831; died in Saint Leonard's, Nov. 1, 1895. She was the second daughter of George Little Craik, the well-known author, and married A. W. May nine years before her death, but continued to be known in the literary world as Georgiana Craik. Her first novel, "Riverston," appeared in 1857, and after that date she published a book nearly every year. Her work was all well done, showing skill in character drawing and in construction of plot, and her books were deservedly popular. They include: "Last and Won" (1859); "My First Journal: A Book for the Young" (1860); "Play-room Stories" (1862); "Winifred's Wooling" (1862); "Faith Unwin's Or-

deal" (1863); "Ladies Tyrant" (1867); "Cousin Trix" (1867); "Mildred" (1869); "Eustace Riddle's Secret" (1870); "How Truly Yours" (1871); "The Countess from India" (1871); "William Kite of Kite" (1872); "Miss Moore" (1873); "Only a Bachelor" (1873); "Theresa" (1874); "Sybil's Choice" (1874); "Anna Warwick" (1876); "Janet Moore's Tyranny" (1877); "Dorcas" (1879); "Two Women" (1880); "Henry's Love Story" (1880); "Mark Devereux's Change" (1880); "Sydney" (1881); "Fanny's Marriage" (1882); "Godfrey Hildens" (1884); "Mrs. Hollister" (1885); "Twelve Old Friends" (1885); "A Daughter of the People" (1887); "Patience Hall" (1891).

Melchers, Paul, a German prelate, born in Münster, Jan. 6, 1812; died in Bonn, Dec. 14, 1895. He was Archbishop of Cologne when the May laws were enacted. He was the first of the German bishops to raise a protest against them, and the first also to defy the Government and pay the penalty for disobedience by being sent to prison on March 21, 1874. When his term of imprisonment had expired the Government demanded his resignation, and on his refusal suspended him from his archiepiscopal functions, and finally dismissed him on June 27, 1874. He continued, nevertheless, to administer his diocese from his place of exile in Holland. When Leo XIII. came to the pontifical throne and France and Germany made overtures for peace with the Church, the Pope gave the deposed Archbishop of Cologne the satisfaction of addressing his communication to the Prussian Government to him, but Bismarck would never consent to his reinstatement. The Pope did not insist, but consoled him by conferring upon him a cardinal's hat, July 27, 1895.

Meredith, Mrs. Louisa Anne Twamley, an English author and artist, born in Birmingham, July 20, 1811; died Oct. 21, 1895. She began early to write and draw, and in 1833 published a volume of "Poems" with etchings made by herself from original drawings. This was followed by "The Influence of Nature"; "Autumn Rambles on the Wye" (1839); and "Our Wild Flowers familiarly described" (1839). On Aug. 12, 1838, Miss Twamley married her cousin, Mr. Charles Meredith, and emigrated with him to Australia. After living five years as Sydney, they removed to Tasmania, in which colony Mr. Meredith served for some time as Colonial Treasurer. He died in 1850, and in consideration of Mrs. Meredith's literary services a pension of £100 a year was granted to her. For her botanical drawings she was awarded medals at the World's Exhibition in London, 1862, and at others in Melbourne in 1864 and 1881, at Sydney in 1870 and 1873, and at California in 1884. No woman in the colony was better known than Mrs. Meredith, who was often lovingly called "The Good Old Lady of Tasmania." In 1861 she visited England, for the first time since leaving it in 1838, and remained in London two years, going through the press her "Last Series of Bush Friends in Tasmania," the illustrations of which show to future generations skill in spite of her having done them in an advanced age after the sight of one eye had been lost. Her works include: "Notes and Sketches of New South Wales" (1844); "My Home in Tasmania" (1867); "Native Flowers, Fruits, and Insects drawn from Nature: Described and Illustrated in Verse"; "Grandmother's Verse Book for Young Australians" (Robert Town); "Some of our Bush Friends in Tasmania" (1844); "Love and Loss" (1861); "Ebba: A Novel" (1867); "Over the Straits" (1867); "The Lace-makers: Sketches of Irish Character" (1868); "Our Island Home: A Tasmanian Sketch-book" (Robert Town, 1879); and "Tasmanian Friends and Foes, Feathered, Furred, etc." (1890).

Metternich, Prince Richard, an Austrian diplomatist, born in Vienna, Jan. 7, 1829; died there March 1, 1895. He was the eldest son of the great Austrian Chancellor. At the age of twenty-two he secured the diplomatic service as an attaché in Paris, and in 1850 he was appointed Austrian ambassador there. At the imperial court he and his wife, Princess Fre-

line Metternich, who was an intimate friend of the Empress Eugénie, were prominent figures. He arranged the meeting between Napoleon III and Franz Josef at Salzburg. After Sedan he aided in the escape of the Empress. He was recalled on the fall of the empire, and thenceforth took no part in public affairs except to vote with the Moderate Conservatives in the Austrian Chamber of Peers. He was devoted to music, and produced several compositions.

Meyer, Hans Wilhelm, a Danish surgeon, born in 1834; died in Venice, June 3, 1895. He practiced his profession in Copenhagen. In 1867 he discovered in the enlargement of the glands between the nose and the throat not only the most common source of deafness, but a very frequent cause of arrested physical and mental development in children.

Meyer, Julius Lothar von, a German chemist, born in Varel, Oldenburg, in 1830; died in Göttingen, April 14, 1895. He became director of the chemical laboratory at Breslau in 1859, and in 1865 went to Karlsruhe as Professor of Chemistry. He was called thence to Tübingen in 1876, and in 1885 he accepted the chemical chair at the University of Göttingen. His most celebrated works are: "Die Gase des Blutes," "Die Modernen Theorien der Chemie," and "Die Atomgewichte der Elemente."

Moncrieff, Lord James Wellwood, a Scottish jurist, born in Edinburgh in 1811; died there April 27, 1895. He was educated at the University of Edinburgh, was admitted to the bar in 1833, and after a brilliant career as an advocate, rose to be Solicitor-General in 1850, and Lord Advocate in 1857. This post he held in all the Liberal ministries, sitting for Leith, Edinburgh, and the Universities of Glasgow and Aberdeen in the House of Commons, until he was raised to the bench in 1869 as Lord Justice Clerk. In Parliament he labored to establish a national system of education in Scotland, and he carried several measures modernizing the old educational institutions. He was elected rector of Edinburgh University in 1868. He was made a baronet in 1871, and in 1874 was raised to the peerage as Baron Moncrieff of Tulliebole. In 1883 he retired. Lord Moncrieff wrote much for the "Edinburgh Review," and to "Fraser's Magazine" he contributed a novel entitled "A Visit to my Discontented Cousin."

Moore, Henry, an English artist, born in York in 1831; died in Margate, June 22, 1895. He was a son of William Moore, a portrait and landscape painter, and brother of Albert Moore, the decorative painter. Henry won a high reputation as a painter of English scenery in broad style on small canvases before he devoted himself to the study of the open sea, and developed a rare art of catching the play of the wind and light upon its surface, and all the forms of waves. His pieces, mostly showing a plain expanse of water, studied in the English Channel, unrelieved by rock or shore or sail, were exhibited and admired in Paris long before they were appreciated by English critics and amateurs. He was made an associate by the Royal Academy in 1885, and an academician in 1893.

Moriet, Berthe, a French painter, born in 1840; died in Paris about March 1, 1895. She was the wife of Eugène Manet, a brother of the painter Édouard Manet, under whose tuition she developed a style of painting that was feminine and subtle, with strong individual characteristics, especially the luminosity that she gave to all her works, whether portraits, interiors, or landscapes. She was particularly happy in catching the bashful grace and the transparent complexion of young girls. In open-air pieces, as in a small painting of the outer harbor of Marseilles, she showed a remarkable power in distinguishing the variations of light. Her "Jeune Femme au Bal" hangs in the Luxembourg.

Murray, Sir Charles Augustus, an English diplomat, born Nov. 23, 1806; died June 3, 1895. He was the second son of the fifth Earl of Dunmore, and was educated at Eton and Oxford. He was master of the royal household in the early years of Queen Victoria's reign; secretary of legation at Naples in 1844;

consul general in Egypt in 1844; British minister in Switzerland in 1853; envoy to Teheran in 1854; British minister in Saxony in 1859; envoy to Denmark in 1866; envoy to Portugal in 1867. In 1866 he was made K. C. B. He was a man of varied experiences and many gifts, and as a writer of popular books was noted for good humor and fair-mindedness. He published "Travels in North America during the years 1833-'36" (1839); "The Prairie Bird: A Tale" (1844); "Hassan, or the Child of the Pyramid" (1857); and "Nouredin, or the Light of the Faith" (1883).

Noailles, Jules, Duc de, a French economist, born in Paris, Oct. 12, 1826; died there March 6, 1895. He devoted himself to economical studies, visited England and the United States to study their economic conditions, and published works on the subject. While his brother was a professional diplomat, long the French minister to the United States, he took no active part in public affairs, but was one of the leading supporters of the Comte de Paris until the pretender entered into the alliance with Boulanger. Till he succeeded his father, in 1885, he was known as the Duc d'Ayen. His works include "De la Décentralisation en Angleterre," "Revue, Capital et Travail," "Recherches sur l'estimation de la Richesse nationale et privée en France et en Angleterre," and "Cent ans de République aux États-Unis."

O'Neill, John, an English philologist, died in Selling, Kent, in January, 1895. He was a clerk in the British War Office for many years, and afterward was sent to Cyprus as accountant general when the British administration was first established there by Sir Garnet Wolseley. In that capacity he adjusted to the new system the complicated and irregular fiscal arrangements bequeathed by the Ottoman rulers and fixed the exchange values of the many sorts of currency used in the island. He devoted his mind to the mastering of languages and was a frequent contributor to the philological journals of London and Paris. He was author of a philosophical work on comparative religion entitled "The Night of the Gods."

Opel, Julius, a German historian, born in Loitschütz, July 17, 1829; died in Halle, Feb. 18, 1895. He studied history and philology at the University of Halle and became a collaborator at the Francke Institute in 1864, and subsequently director of the Halle Gymnasium. He was a hard-working member of the historical commission of the province of Saxony, and for many years president of the Thuringio-Saxon Historical Society. Some of his numerous works are: "Der Niedersächsische Krieg, 1621-'23"; "Der dänische Krieg von 1624 bis 1626"; "Der dänische Krieg von 1627 bis zum Frieden von Lübeck (1894); and a memoir entitled "Denkwürdigkeiten des Rathmeisters Spittendorf" (1894).

Ormsby, John, an Irish scholar, born in Gartner Abbey, Mayo, April 25, 1829; died in Kinsale, England, Oct. 30, 1895. He was educated at Trinity College, Dublin, contributed frequently to periodicals, and was the author of "Autumn Rambles in North Africa" (1864) and "Stray Papers" (1876). He was best known as a Spanish scholar. He translated "The Poem of the Cid," with introduction and notes (1879), and also "Don Quixote," with introduction and notes (1884). His version of the Cid is the only complete one in English, and comes as near as possible to the spirit of the original.

Palmer, Edwin, an English clergyman, born in Mixbury, Oxfordshire, July 18, 1824; died in Oxford, Oct. 17, 1895. He was the youngest brother of Lord Selborne. He was educated at Oxford, and was a fellow of Balliol from 1848 to 1867. He became Professor of Latin in the university, in 1870, resigning that office in 1878 on being appointed Archdeacon of Oxford. He was a ripe scholar, deeply versed in the literature of Greece and Rome, and as tutor and professor at Oxford filled, as has been well said of him, "an eminent place among eminent colleagues." He was one of the revisers of the New Testament and edited the revised Greek text.

Palmer, Sir Roundell, an English jurist, born in Milsbury, Oxfordshire, Nov. 27, 1812; died in Petersfield, Hampshire, May 4, 1895. He was educated at Rugby and Oxford. He was always a High-churchman, and at Oxford his especial friends were Claughton, afterward Bishop of St. Albans, Wordsworth, afterward Bishop of St. Andrews, and Faber. Among his friends in later life was Tennyson, who dedicated "Becket" to him. He was called to the bar at Lincoln's Inn in 1837, and very soon rose to eminence in his profession. He was returned to the House of Commons in 1847 as member for Plymouth, and afterward sat for Bideford. He was knighted in 1861, and from 1868 to 1873 was Attorney-General in Lord John Russell's second administration. He strongly opposed the disestablishment of the Irish Church, declining the offer of the chancellorship and a peerage rather than support that measure. In 1872 he became Lord Chancellor and was elevated to the peerage as Baron Selborne. As counsel for Great Britain in the international court of arbitration which met at Geneva to decide the "Alabama" dispute, he showed signal tact and ability, and the same qualities were conspicuous in his two years on the woolsack at this period and from 1880 to 1885, when he was Chancellor for the second time. When Mr. Gladstone's third administration was formed, in 1886, Baron Selborne declined to enter the Cabinet on account of his opposition to the Premier's home-rule views. For the rest of his life he remained a Liberal Unionist. He spoke against the home-rule bill in the House of Lords in 1884, and actively opposed Lord Rosebery's proposition to disestablish the Welsh Church. He published in 1892 a hymnal entitled "The Book of Praise," much valued for its able editing, and contributed the article on "Hymns" in the ninth edition of the "Encyclopædia Britannica." He was also the author of "A Defense of the Church of England against Disestablishment" (1886) and "Ancient Facts and Fictions concerning Churches and Tithes" (1888).

Payne-Smith, Robert, an English clergyman, born in Chippenham, Gloucestershire, Nov. 7, 1819; died in Canterbury, March 31, 1895. After leaving Oxford he took orders, and was successively curate at Cranston, Long Winchenden, and Thame. In 1853 he became head master of the Kensington Proprietary School, and in 1859 sublibrarian of the Bodleian Library. He published in Syriac and English the commentary of Cyril of Alexandria on St. Luke (1859); a translation of the third part of the "Ecclesiastical History of Johannes Ephesus" (1860); a "Catalogue of the Syriac Manuscripts in the Bodleian Library" (1865); and "The Authenticity and Messianic Interpretation of the Prophecies of Isaiah" (1867). In 1868 he was made Professor of Divinity at Oxford, and he was Bampton lecturer for 1869, the subject being "Prophecy a Preparation for Christ." In 1870 he accepted the deanery of Canterbury, and in this office his moderate views made him popular not only with the various schools of thought in the Church, but with the nonconformists as well. His great work as an Oriental scholar was the "Thesaurus Syriacus," on which he was engaged for the last thirty-six years of his life. He was for fifteen years a member of the Old Testament Revision Committee (1870 to 1885). His later publications include an "Exposition of the Historical Portion of Daniel" (1886) and several commentaries.

Peel, Sir Robert, an English politician, born in London, May 4, 1822; died there May 9, 1895. He was the eldest son of Sir Robert Peel, the statesman, and succeeded to the baronetcy at his father's death, in 1830. He entered the House of Commons that year and was ranked among the Liberals for many years, but afterward allied himself with the Conservatives, and when he was defeated in 1859 as a Conservative candidate his political career came to an end.

Petriz, Floriano, ex-President of Brazil, born in 1841; died in Rio de Janeiro, June 29, 1895. He entered the Brazilian army, and served through the war with Paraguay in 1865-70, after which he resigned

to oversee his estate. After the liberation of the slaves had reduced him almost to poverty he joined the army again. On the overthrow of the empire he at once gave his adhesion to the republic, and was nominated a Senator. He was elected Vice-President of the republic in 1891. He sided with the Congressional party and the navy in their resistance to the dictatorship of President Fonteneau, but when the latter retired, transferring the supreme power to him, he stood firmly by the Constitution and confronted the civil war that followed with energy and tenacity, finally overcoming Admiral de Morais. He successfully completed his term of office as Acting President in November, 1894, and then peacefully resigned his powers to his chosen successor, Francisco de Morais, and withdrew from public life.

Perkins, Ignazio, an Italian priest, born in Naples, Jan. 20, 1822; died in Rome, Dec. 9, 1900. He was created a cardinal on Jan. 16, 1888, and was member of the Congregation of Indulgences and Holy Sacraments.

Poole, Reginald Stuart, an English Egyptologist, born in London, Feb. 27, 1832; died there Feb. 2, 1895. He was taken to Egypt when ten years of age by his uncle, Edward Lane, and during the years that he spent there, while his uncle was compiling the "Arabia Felix," he became so deeply engrossed in Egyptology that at the age of seventeen he wrote the papers on Egyptian chronology that were afterward published under the title "How Egyptians" (1851). In 1850 he obtained a place in the department of antiquities in the British Museum. He lectured on Egyptology and numismatics. In 1861 he was appointed assistant keeper of coins in the museum, and in 1870 he succeeded Mr. de Saut, Mr. Vasey. He was one of the earliest and most important students of the lessons in art and history to be read in coins. During the twenty-two years that he was keeper of coins he edited 15 volumes of the catalogues of Greek, Roman, Anglo-Saxon, Persian, Arabic, Indian, and Chinese coins. He published "Coins of Egypt" (1883). In 1885 he became Professor of Archaeology at University College.

Portalis, Jean, a Belgian painter, born in Verviers in 1818; died in Brussels, Feb. 8, 1900. He won the Roman prize at the Paris Art School in 1847, and after completing his studies in Rome went to Egypt, where he painted a portrait of Mehmet Ali and made many sketches that were exhibited at the Paris Exposition of 1855. From a second sojourn in the Orient he brought back many new studies. He spent also considerable time in Hungary. In 1867 he was appointed director of the Art Academy in Ghent, and in 1868 he went to Brussels as a professor in the academy, of which he became director in 1870. While his earlier works reflected the strictly classic method, he gradually emancipated himself from classic traditions. His "Luge de l'Opere de Froth" hangs in the Brussels Museum. He established in 1881 a free atelier, in which were trained Emile Wauters, Cornu, Impens, and other eminent artists.

Rawlinson, Sir Henry Creswell, an English Orientalist, born in Oxford, April 11, 1810; died in London, March 3, 1895. He went to Bombay in 1837 as a military cadet of the East India Company. He had already begun the study of Oriental languages, and he became so proficient in Persian and Malabar that in less than a year he was made interpreter, and after another year paymaster of his regiment. In 1840 the Governor-General sent him, with other officers, to Persia, in connection with the scheme of giving military aid to that country. During the six years that he remained there he did various good, from paymaster to charge d'affaires. He traveled through parts of the country that had never been visited by Europeans, and discovered archaeological remains, to the study of which he gave much attention. He and his brother officers were recalled when war was declared against Persia in consequence of the Shah's attack upon Herat. He was sent in Calcutta as assistant to the British envoy, and was soon appointed political agent at Candahar. After the murder of the envoy

at Cabul Rawlinson turned all the Afghans out of the city and prepared for the siege that followed. His disposition of the artillery saved the city from being taken by assault when the Afghans burned one of the gates. In the battle of May 29, 1842, he saved the day with a band of Persian cavalry that he had trained. Major Rawlinson finally retired with the garrison. He obtained the appointment of resident for the East India Company and British consul at Bagdad, where he remained from 1843 till 1856. Then he returned to England, was elected to Parliament in 1857, advocated the transfer of India to the Crown, and when the bill was passed in 1858 was made a member of the new India Council. In 1859 he was sent to Persia as minister plenipotentiary, remaining a year. After his return he sat in Parliament and raised the cry of warning against the Russian advance in Asia. He was made a life member of the India Council in 1863. After the Russians annexed Khiva he published "England and Russia in the East" (1873). His earliest archaeological notes are found in a narrative of a tour through Susiana and Elimalis in 1837, which he supplemented with a description of Ecbatana that earned for him the gold medal of the Geographical Society. He began to copy the cuneiform inscriptions at Behistun in 1835. On his appointment to the Bagdad consulate he studied the remains excavated by Botta at Khorsabad, and through his familiarity with the old Persian characters on the rock tablets at Behistun he was able to decipher, in 1844-45, the ancient Persian translations in which the Assyrian legends and history were preserved. In 1846 he published his first work on the cuneiform inscriptions. In 1847 he obtained complete copies of all the inscriptions, the most important of which were found in a dizzy location on a precipitous rock. These copies he took to England in 1849. He read during his visit the famous paper on the cuneiform inscriptions of Assyria and Babylonia containing a translation of the inscription of the black obelisk. He deciphered an inscription brought home by Layard containing a chronicle of the war between Hezekiah and Sennacherib. In 1851 the British Museum granted £2,000 for excavations in Mesopotamia, for which Sir Henry Rawlinson employed Hormuzd Rassam. He was knighted on his return from Bagdad in 1858, and made a baronet in 1891.

Reeve, Henry, an English historian, born in Norwich in 1813; died in Christ Church, Hampshire, Oct. 21, 1895. He was educated at the Academy of Geneva, Switzerland. From 1837 to 1837 he was Registrar of the Privy Council, and in 1855 he became editor of the "Edinburgh Review." In 1835 he published a translation of De Tocqueville's "Democracy in America," which passed through many editions, and in 1856 a translation of De Tocqueville's "France before the Revolution of 1789." He was also the author of a translation of Guizot's "Washington" (1840). His original works include "Graphidæ; or, Characteristics of Painters" (1853); "Royal and Republican France" (1872); and "Petrarch," in the series of "Foreign Classics" (1878).

Raffa-Sella, Luigi, an Italian prelate, born in Palermo, April 16, 1840; died in Rome, May 29, 1895. He was distinguished for refined wit and artistic taste, and on account of these qualities Leo XIII made him major-domo of the Vatican palace. He suggested and oversaw the restoration of the Sistine Chapel and of the Borgia apartments. He was created a cardinal on Dec. 14, 1891.

Salisbury, William Noel, an English author, born in London, July 7, 1825; died there March 9, 1895. He was appointed to a post in the Public Record Office, and remained there until his retirement in 1892. He published: "Original Unpublished Papers relating to Sir Peter Paul Rubens as an Artist and Diplomat" (1869); "Colonial Calendar of State Papers: America and West Indies, 1574 to 1665" (1860-'60); "Colonial Calendar of State Papers: East Indies, China, and Japan, 1517 to 1629" (1849-'53); and "Hearts of Oak: Stories of Early English Adventure" (1870).

Saint-Hilaire, Jules Barthélemy de, a French statesman, born in Paris, Aug. 19, 1805; died there Nov. 22, 1895. He held a post in the Ministry of Finance when Charles X was king, and became a friend of Thiers and a contributor to the "Globe" and other journals. He signed the protest against the ordinances of Polignac with which the revolution of 1830 was inaugurated. When the Orleans Government was established he found that his ideas of government differed radically from those of Thiers and the organizers of the constitutional monarchy. He protested vigorously against the new order of things in newspaper articles, then withdrew from politics and devoted himself to translating Aristotle (1838). He was then called from the assistant professorship of French Literature in the Polytechnic School to the chair of Greek and Latin Philosophy in the Collège de France, and in the following year was rewarded with a seat in the Academy of Moral and Political Sciences. Cousin made him his first assistant in the Ministry of Public Education, but he soon retired to immerse himself for eight years in his work on Aristotle's complete writings and in the study of Sanskrit literature. When the revolution of 1848 was accomplished he was elected to the Assembly, and for a short time was honorary secretary to the Provisional Government. After the election of Louis Napoleon as President he voted for certain repressive laws, but he refused to recognize the *coup d'état* or to take the oath of allegiance to the Emperor. Nevertheless he was requested to retain his professorship in the Collège de France. He declined and went to Egypt with Lesseps when the latter was working out his Suez Canal project, and wrote a series of letters to a Paris newspaper. On his return he produced further installments of the translation of Aristotle, and treatises on Buddhism, the Vedas, the Koran, and Mohammed. He resumed his intimacy with Thiers, who made him secretary general of his Cabinet in 1871. This post he filled till 1873. In 1880 he succeeded Freycinet as Minister of Foreign Affairs in the Cabinet of Jules Ferry. He was a Conservative Republican and an advocate of conciliation, having no sympathy with the aggressive radicalism that prevailed in the Chamber. The remainder of his life was passed quietly in literary occupations and attending to his duties in the Senate, of which he was a life member. He published a "Life of Cousin."

Sala, George Augustus Henry, an English journalist, born in London in 1828; died in Brighton, Dec. 8, 1895. His father, an Italian, married a popular English singer, and the son was brought up with the expectation that he would become an artist. Young Sala, however, early became a contributor to "Household Words," as well as a close copyist of the style of Mr. Dickens. He founded the "Temple Bar Magazine," of which he was the first editor, and in the earlier portion of his career wrote much for periodicals. In 1863 he visited the United States as a correspondent of the London "Daily Telegraph," and in 1864 visited Algeria in the same capacity. During the Franco-Prussian War Mr. Sala was the war correspondent to the "Daily Telegraph," and he was dispatched by that journal to various parts of the world on other important occasions. For several years he conducted a weekly paper entitled "Sala's Journal," and having published in its columns in 1892 an attack on a labor organization known as the "Domestic Servants' Union" was subsequently mobbed in Hyde Park. He made large sums in journalism, but was recklessly extravagant and finally became bankrupt. The close of his life was embittered by failing health and broken fortunes, although the "Daily Telegraph" granted him a pension of \$5,000 a year. A month before his death he became a Roman Catholic. He was brilliant and versatile, but his work was all ephemeral, and much of it is already forgotten. His many writings include: "La Belle Alliance" (1856); "A Journey due North" (1858); "Twice Round the Clock" (1859); "Lady Chesterfield's Letters to her Daughters" (1860); "Dutch

Pictures (1861); "The Two Prima Donnas" (1862); *Assorted Addresses* (1862); "Breakfast in Bed" (1864); "Quite Alone" (1864); "My Diary in America in the Midst of War" (1865); "Trip to Barbary by a Roundabout Route" (1865); "From Waterloo to the Peninsula" (1866); "William Hogarth: Essays" (1868); "Charles Dickens" (1870); "America recalled" (1882); "Living London" (1883); "A Journey due South" (1885); "Famous People I have met" (1887); "My Life and Adventures" (1895).

Saunders, John, an English novelist, born in Barnstable in August, 1811; died in Richmond, March 29, 1888. His earliest book was a volume of poems, and in 1845 he published an excellent little work called "Coldest Pictures of English Life from Chaucer." "The People's Journal," the earliest of illustrated magazines, was founded by him in 1846. Besides a drama, "Love's Martyrdom," he was the author of the novels: "The Shadow in the House" (1860); "Abel Drake's Wife" (1862); "Martin Pole" (1863); "The People against the World" (1865); "Bound to the Wheel" (1866); "Hirel" (1869); "Israel Mort Overman" (1876); "The Shipowner's Daughter" (1876); "The Lion in the Path" (1876); "Jasper Deane" (1877); "The Sherlocks" (1879); "The Tempter Becked" (1880); "The Two Dreamers" (1880); "Victims or Victims" (1883); "A Noble Wife" (1884); and "Miss Vandeleur" (1884). "Abel Drake's Wife," which he dramatized, was the best of his novels. His daughter, Mrs. Katherine Saunders Cooper, was author of "Gideon's Rock" and other novels.

Savory, Sir William Scovell, an English surgeon, born in 1800; died in London, March 4, 1893. He was connected throughout his professional life with St. Bartholomew's Hospital. He entered the College of Surgeons in 1847, gained the medical scholarship of London University in 1848, became a fellow of the College of Surgeons in 1852, and devoted himself to surgery. For some time he was Professor of Comparative Anatomy and Physiology, and for several successive years he was President of the College of Surgeons. His skill in surgical manipulation was famous. He was made a baronet in 1890. He wrote a book called "Life and Death."

Scharf, Sir George, an English artist, born in London in 1820; died there April 19, 1893. He was the son of a Bavarian artist settled in London, and after going through the University College school studied art at the Royal Academy and began to illustrate books. He went to Lycia with Sir Charles Fellows to draw the illustrations for his book, made a success in 1847 with his designs for Macaulay's "Lays," and produced fine drawings for Milman's edition of *Horace* (1849) and for Smith's "Dictionary of Antiquities." He lectured at the Royal Institution on ancient art, and was made director of the National Portrait Gallery, established in 1857. That great collection was made by him, and when he retired in 1884 he was knighted.

Schreck, Karl Emanuel, ex-President of the Swiss Confederation, born in Bern in 1823; died there July 28, 1888. He was educated as a Protestant minister, was chaplain to the Bern Battalion in 1847 during the campaign against the Sonderbund, and afterward pastor of a church at Scherpfen. Having won a high reputation as a Radical orator in the agitation against the Jesuits, he was in 1855 elected a member of the Government by the Great Council of Bern, and from that time took a prominent part in Swiss public affairs. He represented the canton of Bern in the Council of State from 1857 till 1865, was Vice-President of the Federal Council in 1862, and was President of the Confederation in 1865, 1871, 1874, 1878, 1880, and 1883. At the time of his death, which resulted from a carriage accident, he was chief of the Department of the Interior.

Secréta, Charles, a French philosopher, born in Lausanne in January, 1815; died there Jan. 22, 1893. He became Professor of Philosophy at the University of Lausanne in 1838, and left it in 1840 to teach in the academy of Neuchâtel, but returned to his old post

in 1844. In his philosophical works he endeavored to harmonize reason and religion, accepting the moral sciences as intuitive. He wrote on social ethics and politics, with strong sympathy for the common people, showing a tendency toward socialism. The Darwinian theory he accepted, and reconciled it with theology. His philosophy was expounded in "Philosophie de la Liberté," "Recherches de la Méthode," and "La Science et le Christianisme." A later work is "La Civilisation et les Croyances." He wrote also an exposition of the philosophy of Leibnitz, a critical dissertation on Cousin's philosophical method, and a work entitled "L'Idée, L'Histoire."

Seeborn, Henry, an English naturalist, born in Bedford, Yorkshire, about 1804; died in London, Nov. 26, 1882. He was educated at the Friends' School in York, and became a steel manufacturer in Sheffield. He was an enthusiastic student of ornithology, and his "History of British Birds and their Eggs" is an authority. His other works include 2 volumes of travels, "Siberia in Europe" (1860) and "Siberia in Asia" (1862); "The Geographical Distribution of the Charadriidae" (1864); and "The Birds of the Japanese Empire" (1868).

Seely, Sir John Robert, an English historian, born in London in 1844; died Jan. 18, 1900. His father was a London publisher, and the son was educated at the City of London School and at Cambridge, where he was graduated in 1867. In 1868 he became Professor of History at Cambridge University, being at that time widely known as the author of "From Rome," a book that he never definitely acknowledged as his own. This famous work appeared in 1860 and was fiercely attacked by the evangelical party. It induced to order the opinions of various thinkers compelled to revise their conceptions of Christ in the progress of events, and was a stimulus to the thoughts of that time. He had previously published "Classical Studies: An Introductory Lecture" (1863), and after the appearance of "From Rome" his works in that order include "Roman Imperialism" (1869); "The Life and Reign of Edward I," a reworking of an earlier work entitled "The Greatest of all the Plantagenets" (1872); "Lectures and Essays" (1876); "Life and Times of Steen" (1879); "Natural Religion" (1884); "Horace Walpole and his World" (edited, 1885); "The Expansion of England" (1883); "A Short History of Napoleon the First" (1885); "One Hundred Expansion: Extracts from the Expansion of England" (1887); and "Goethe renewed after Fifty Years" (1894). His style is clear and unobscure, and he aims to be exact, impartial, and judicious rather than brilliant or picturesque. In this respect he is the exact opposite of his contemporary *Frederick*. There are indications here and there that this avoidance of ornament and picturesqueness was not the result of a lack of power in that direction, but came from his earnest desire to preserve the truth of history. The influence he exerted as a theologian was far-reaching and is shown in much of the thought and tolerance of the Church of England now.

Sharpe, John, an English clergyman, born in 1801; died at Emsley Lovett, Devonshire, Warrandale, Dec. 7, 1880. He was graduated at Cambridge in 1829, ordained in 1831, and for two years held the living of Gosling in Norfolk. In 1833 he became rector of Emsley Lovett. He published "Moses: A New Translation with Notes" (1850); "Notes and Dissertations on the Prophecy of Hosea" (1861); and "The Tree of Life." He was a brilliant scholar of conservative views, and was very strongly opposed to the modern school of higher criticism.

Sime, James, a Scottish writer, died in London, March 11, 1866. He was for many years the literary adviser of the Messrs. Macmillan, and was the author of "A History of Germany" (1824); "Loving" (1877); "Democracy, the People's Book: Its Origin and Nature" (1877); "Sabbath" (1880); "The Kingdom of All Israel: Its History, Literature, and Worship" (1882); and "Life of Goethe" (1883).

Smith, George, an English reformer, born in Tunstall, Staffordshire, in February, 1831; died near Rugby, June 21, 1893. He was the son of a brickmaker, and was put to work in the brickyards at the age of seven. Two years later he was working thirteen hours daily, carrying heavy weights on his head almost continuously. He secured an education with difficulty, and before he was thirty spoke and wrote in regard to the urgent necessity for legislation in behalf of the brickmakers. As the direct result of his efforts, an act of Parliament was passed in 1871 providing for Government inspection of brickyards and regulation of labor in them. He next turned his attention to the deplorable condition of life on the canals, and stated in the "Fortnightly Review," in 1873, that of 100,000 men, women, and children employed on the rivers and canals of the kingdom, 95 per cent. could neither read nor write, and 90 per cent. were drunkards. After several years of persistent agitation the canal-bills act was by his influence introduced into Parliament in 1877 and became a law Jan. 1, 1878. The last sixteen years of his life were spent in the endeavor to bring gypsy children within the scope of the education acts. Mr. Smith was the author of "The Cry of the Children from the Brickyards of England," "Our Canal Population," "Canal Adventures by Moonlight," "Gypsy Life," and "I've been A-gypaying."

Sponder, Mrs. Lillian (Hendland), an English novelist, born in London in 1838; died in Bath, Somerset, May 4, 1893. She was the daughter of Edward Hendland, a London physician, and at twenty married John Kent Sponder, a physician of Bath. She began to contribute to periodicals before her marriage, and throughout her life was active in promoting the movement for a wider range of work for women. Her first novel, "Brothers-in-law," was published in 1869. Later ones were: "Her Own Fault" (1871); "Parted Lives" (1873); "Jocelyn's Mistake" (1874); "Mark Eylmer's Revenge" (1876); "Both in the Wrong" (1878); "Till Death do us Part" (1881); "Mr. Nobody" (1884); "Recollections of a Country Doctor" (1885); "Kept Secret" (1888); "Awakening" (1892); and "No Humdrum Life for me" (1893). She was the mother of 8 children, and her 4 sons were educated at Oxford and Cambridge on the receipts from their mother's books.

Stambuloff, Stefan, a Bulgarian statesman, born in Tirnova in 1855; died in Sofia, July 18, 1895. When several Bulgarian youth were selected to be educated in Russia at the expense of the Russian Govern-

ment he was one of those chosen, and was placed at the age of seventeen in the theological seminary at Odessa, where he imbibed more of nihilism and republicanism than of theology. He was a bright, but not a plodding student, nor was he amenable to discipline, and at length he was expelled. Then Krivtsoff, the agent of the Slav Society, who looked after the Bulgarian students, took him into his law office as a clerk, but

he finally discharged the refractory youth, who left for Giurgevo, where he found employment for a time with a soap merchant, and then went back to his native town and worked in a brewery. When the insurrection in Bosnia and Herzegovina broke out young Stambuloff, who in the ancient capital of the Bulgarian Czars conceived ardent hopes of a free Bulgaria, was one of the foremost organizers of the revolutionary party. When the Russo-Turkish War

began he enlisted in the Russian army. When Bulgarian independence was at length established, he opened a law office in Rustchuk, and obtained a little practice. As one of the chiefs of the party that drew up the democratic Constitution of Tirnova, he was elected to represent that Radical stronghold in the Sobranje. Prince Alexander, neglecting the Liberals, who represented the sentiments of the nation, selected his ministry from the small Conservative party, and dissolved the Sobranje when it passed a vote of censure against the ministers. Stambuloff attached himself to Zankoff, but deserted that politician on account of his intrigues with the Russians, and became himself the chief of the Radical wing of the Liberal party. His influence in the country was strengthened by his remarkable disinclination to accept office. In the summer of 1884 he used his influence to effect the overthrow of Zankoff, and he was chosen president of the Sobranje that was elected to sustain the second Karaveloff Cabinet. The revolution of Philippopolis, which brought about the union of Bulgaria and Eastern Roumelia, was accomplished at Stambuloff's instigation by his intimate friend Stoyanoff. When Prince Alexander was abdicated, in August, 1886, Stambuloff, as president of the Sobranje, issued a proclamation from Tirnova denouncing as traitors the members of Zankoff's Provisional Government, and appointing Col. Mutkuroff his brother-in-law, commander in chief of the Bulgarian army. His partisans throughout the country seized the telegraph stations, and the loyal part of the army acted promptly on his suggestions, with the result that the Provisional Government collapsed in three days, and he appointed, in the Prince's name, a Cabinet of which Radoslawoff was the head. He welcomed the Prince at Rustchuk, but acquiesced in his final abdication, being impelled to give up the Prince by a threatening telegram from the Czar. When Alexander departed he committed the powers of the throne to a council of regents, of which Stambuloff was the head and Karaveloff and Mutkuroff the other members. The first regent soon concentrated all power in his own hands by discarding Karaveloff, who was replaced by Jivkoff, an intimate friend of Stambuloff. The Czar, who had promised not to interfere except in case of anarchy, did not think it possible for Bulgaria to exist under an anti-Russian régime, and it was long before he appreciated the strength of the spirit of independence and the amazing energy and resourcefulness of Stambuloff, who, with the support of England and the sympathy of Europe, foiled every effort of the Russians to overturn him. When he procured the election of Prince Ferdinand by the Grand Sobranje, July 4, 1887, he did not lay down his powers, but as Prime Minister imposed his will upon the new Prince. Stambuloff suppressed the plot of Major Panitz and other attempted risings with cruel severity, and made many mortal enemies; but his tyrannical rule was not resented by the people, who were not overtaxed and who prospered under the conditions of quiet and order enforced by Stambuloff. After some of the leaders of the Opposition had been shot, imprisoned, or driven into exile, the rest were so terrified that few candidates appeared to contest the election of 1890 against the Government. Not only the British and the Austrian governments, but Austria's partners in the triple alliance were won over by Stambuloff's success in preserving order. In 1891 the Prime Minister narrowly escaped assassination, the Minister of Finance being struck down in mistake. His acts of vengeance against all rivals and antagonists so multiplied his enemies that he began to grow unpopular. He sacrificed in a measure his reputation for patriotism by changing the Constitution so as to allow the heir to the throne to be baptized as a Roman Catholic. On seeing his position weakened, the ungrateful Prince turned upon him and began to rebel against the dictation of his autocratic Prime Minister. Ferdinand hoped that if Stambuloff would step aside he could become reconciled to the Czar and recognized

as the legitimate Prince. On May 29, 1894, Stambuloff astonished the world by voluntarily resigning his office. The Prince publicly professed gratitude to the retiring president of the Council, but before long he was counted among the enemies of the fallen dynasty, who were now bold and fierce enough. Stambuloff had friends, too, many and influential, but the authorities would not protect him, and he knew that he would be assassinated. When his request to be allowed to go to a foreign watering place was denied, he saw that he was doomed. He even knew who were to be his murderers, yet with his wonted fortitude he quietly awaited his fate. At last, when returning in the morning from his club, he was set upon and mortally wounded and shot by 4 men, whose escape the police constituted, while they arrested Stambuloff's friends and servants. Even at his grave a demonstration of hatred was made by some army officers. His slayers were the avengers of persons whom Stambuloff had doomed to death by judicial process.

Stepnik, Sergius Michael Dragomanoff, a Russian author and revolutionist, born in Ilajatsch, in the Caucasus, in 1841; died in London, England, Dec. 23, 1895. He was descended from a family of Cossack origin belonging to the minor nobility in the government of Poltawa. While a student at Kieff, between 1862 and 1864, he published books in the Little Russian dialect, the circulation of which was prohibited by the Russian Government in 1862 on account of their political tendency. He became a tutor of ancient history in the University of Kieff in 1865, and a professor in 1870, but was removed from his chair in 1875, and in 1876, in consequence of strictures on the methods of justice permitted under Count Tolstol, the Minister of Justice, he was compelled to flee to escape deportation. Settling in Geneva, he produced works in the Little Russian dialect that made a stir in Russia, and in 1877 began a series of reviews under the title "Ilromada." While not accepting socialism, he assailed the autocratic system and advocated equal rights for all Russians. Removing to England, he wrote newspaper and magazine articles and books in the English language. His principal works are: "The Turks within and without"; "Tyrannicide in Russia," "Past European Peoples," "Little Russian Internationalism," "The Propaganda of Socialism," and "Historical Poland and the Muscovite Democracy," besides his monographs on the ethnography, history, and literature of Little Russia. With M. Antonovich he collected and edited Little Russian folk songs.

Stevenson, Joseph, an English historian, born in Berwick-on-Tweed, Nov. 27, 1806; died in London, Feb. 5, 1895. He was the son of a surgeon, and was educated at Glasgow and Durham Universities; worked in the British Museum on the Arundel manuscripts; arranged the chapter records of Durham Cathedral; received the degree of M. A. for his work; and was ordained by the bishop, though he had previously contemplated entering the Presbyterian ministry. He continued his literary work, however, editing Boucher's "Glossary of Archæic and Provincial Words"; "Latin Hymns of the Anglo-Saxon Church"; "The Lindisfarne and Rushworth Gospels"; "Chronicles of Melrose and Lanercost," and other volumes for the Bannatyne, the Maitland, and the Roxburghe Clubs and the English Historical Society. From 1849 till 1862 he was Vicar of Leighton Buzzard, in Bedfordshire, and during this period he published "Church Historians of England" (1853); "Chronicon Monasterii de Abington"; "Letters and Papers illustrative of the Wars of the English in France, temp. Henry VI"; and "Narratives of the Expulsion of the English from Normandy." In 1863 he joined the Roman Catholic Church. He obtained a post in the Record Office and issued a "Calendar of State Papers of the Reign of Elizabeth," followed by "Documents illustrative of the History of Scotland, 1258-1304." At the age of sixty-three, on his wife's death, he entered St. Mary's College, Ascot, as a student and a lecturer, and at the same time was

employed by the Historical Manuscripts Commission to examine collections of manuscripts owned by corporations and private families. He was ordained a Roman Catholic priest in 1872, and was sent to Rome by the English Government to examine the archives of the Vatican in search of documents illustrative of British history. On his return to England, in 1877, he entered the Novitiate of the Society of Jesus at Rushmore, and when his period of probation was ended he engaged in missionary labor and resumed his literary activity. He contributed to the "Month" and other periodicals, edited May's "History of Mary Stuart" (1882), and published "The Truth about John Wyclif" (1882) and "The First Years of the Life of Mary Stuart" (1884).

Süppé, Franz von, an Austrian musical composer, born in Spalato, Dalmatia, April 20, 1819; died in Vienna, May 21, 1895. His family, originally from Belgium, had for two generations been settled in Cremona, Italy. His early proficiency with the flute and other instruments, his acquaintance with Beethoven, who was his uncle, and his strong love of music impelled him to adopt a musical career. He had received some training at the Vienna Conservatory and had begun to compose operas, symphonies, quartettes, etc., at the age of fourteen, and at fifteen produced a mass of his own in the church at Lienz. After a thorough course at the musical academy, and after receiving valuable instruction from Donizetti, he was appointed, at the age of twenty-one, Professor of Harmony in the academy and engaged as conductor of the orchestra of the Josephstadt Theater. He was afterward conductor at Presburg, but went back to Vienna in 1844. He composed the music for 3 grand operas and for 160 musical dramas and comedies, besides requiems, symphonies, overtures, and other concert pieces, of which the most successful was the overture to "Post and Penman." He had no striking success until he produced the opera "Furiantza" in 1876, which was followed in 1879 by "Bohacacelo." His other last-known works are "Zehn Mädchen und kein Mann"; "Frau Sarsche"; "Die Schöne Galathea"; "Lieders Kavalier"; "Denna Juantia"; and "Edelmans."

Sybel, Heinrich von, a German historian, born in Düsseldorf, Dec. 2, 1817; died in Marburg, Aug. 1, 1905. He was the oldest son of a Prussian jurist, who was ennobled in 1831. After a successful course at the gymnasium of his native city, where he showed his preference for history, especially for Niebuhr's classical Roman history and Edward Burke's works, he went to the University of Berlin as a pupil of Leopold von Ranke and of Savigny, with whom he studied history and law from 1836 to 1839. Ranke had just founded the first of those historical year-books which are the pride of the German universities as temples of original research. In 1839 Sybel was graduated as a doctor with the thesis "De diplomate libri Justiniani de origine servorum gentium," a sagacious investigation of the sources of the great historian of the Goths. In 1840 he became a private tutor at the University of Bonn, and one year later he published his "Geschichte der ersten Kreuzzüge" (Düsseldorf, second edition, 1841), in which he destroyed the legend of Peter the Hermit as the originator, and Godfrey of Bouillon as the leader of the first crusade. He was appointed professor extraordinary in 1844, and published "Entstehung des deutschen Königtums" (second edition, 1845), the conclusions of which were strongly attacked by Georg Waitz and Felix Dahn, the two greatest authorities on that subject. In the same year Sybel wrote, with the Orientalist Gildemeister, "Die Constitution des heiligen Römischen Reichs," a polemic against the clerical party and the pilgrimages to the holy seat in Treves. The next year he was called to a full professorship in Marburg and elected to the Diet of the Rhenish Electors, and in 1850 after the Imperial Diet at Erfurt. By a special effort of King Maximilian of Bavaria, he was called to the University of Munich, where he soon became a member of the Acad-

erny of Sciences. He founded the first historical seminary in Munich; organized with Ranke the Historical Commission of the Bavarian Academy, whose first secretary he became and later its president; caused the publication of the German records of the diets; and founded in 1859 the "Historische Zeitschrift." But political differences induced him to resign in 1861 and return to Bonn as Dahlmann's successor. He became a member of the Prussian House of Representatives at the time of the constitutional conflict between the Government and the Parliament on the question of the reorganization of the Prussian army, for which the House declined to make appropriations. Sybel joined the anti-Bismarckian party; but, fortunately for his future, he was obliged, on account of an eye disease, to leave the House in 1864. Meanwhile he published "Die deutsche Nation und das Kaiserreich" (Düsseldorf, 1862), sharply criticizing the nebulous policy of the empire during the Middle Ages. During his Bonn career he also published "Kleine hist. Schriften" (3 volumes, Munich, 1863-'69); "Vorträge u. Aufsätze" (Berlin, 1874); "Klerikale Politik im 19. Jahrhundert" (Bonn, 1874). But the work that established his world-wide fame is the "Geschichte der Revolutionszeit von 1789-1800," in 5 volumes, which he had begun during the storm and stress period of 1848 (1853-'80). In this work he has shown that the great revolution was one single process of disintegration in the destruction of Capetian France and the degenerate holy Roman Empire and the partition of Poland. The entire work was based upon the hidden sources collected in the archives of the principal capitals of Europe. In the spring of 1867 he was elected a member of the Constitutional Diet of the North German Confederation, and joined the Moderate National-Liberal party. After his resignation he founded in Bonn the "Deutscher Verein der Rheinprovinz," the principal instrument against the Ultramontane party. In 1874 he was elected a representative for Magdeburg, and in 1876 and 1879 was re-elected. The year 1875 marks the most important epoch in his life, when he was called by Emperor William I to be director of the Prussian state archives and the Berlin secret archives as well as of the "Acta Borussica," the chief source of the history of Prussian administration in the eighteenth century. In this capacity, and as a member of the Berlin Academy of Sciences, he began the publication of the archive documents in 1878, and 62 volumes of the most unique and valuable historical matter have appeared. At the same time he began by order of the academy, together with Max Duncker, an edition of the political correspondence of Frederick the Great. He was also a member of the Central Commission of the "Monumenta Germaniae historica." In 1881 Prince Bismarck authorized Sybel to use the Prussian archives in preparing the newest history of Prussia and Germany. As the fruit of these researches arose Sybel's monumental work, "Begründung des deutschen Reiches durch Wilhelm I.," the first volume of which appeared in 1889, and Vols. VI and VII, comprising the history of the North German Confederation and the origin of the war of 1870, at the close of 1894. It is unsurpassed in the art of relating diplomatic negotiations, and is thoroughly German, and yet it shows rare moderation and justice in judging enemies. With this work, which was to be concluded with the eighth volume, Sybel's life was ended. June 13 he traveled to Marburg, where his son Ludwig is Professor of the History of Arts at the university. While writing a letter to a French publicist concerning the causes of the Franco-Prussian War he was seized with paralysis of the lungs, and he died the next day. Sybel was the most excellent representative of that brilliant epoch of German historiography which, beginning in the forties of this century, received its peculiar character under the pressure of the political and national revolutions in Germany and strongly contributed toward the establishment of the modern German Empire. Prince Bismarck seven years ago thanked him "for his long

co-operation in the common patriotic work of founding the empire."

Taaffe, Graf Eduard, an Austrian statesman, born in Vienna, Feb. 24, 1833; died in Ellisehau, Nov. 29, 1895. In his childhood he was the companion of the Archduke Franz Josef, who became Emperor. He entered the public service in 1852, and rose rapidly, becoming Governor of Salzburg in 1863 and Stadthalter of Upper Austria in 1867. In the same year he entered the Austrian ministry under Graf Beust as Minister of the Interior. When the *Bürgerministerium* was formed, Dec. 30, 1867, he received the portfolio of National Defense, and when Prince Auer-Sperg retired he took provisionally the presidency of the Council. When the Hohenwart ministry came in, Taaffe was appointed Governor of the Tyrol, and after filling that office for eight years he was called into the Stremayr Cabinet as Minister of the Interior in February, 1879, and in the following August he formed a new Cabinet, in which, in addition to the presidency, he took the portfolio of the Interior. The Taaffe régime was characterized by the disappearance of the constitutional theories and the growth of federalism. He was originally an adherent of the Constitutional group, but was gradually alienated from the German Liberals. He had finally to rely upon the support of the Clerical Feudalists, the Czechs, and the Poles, in carrying out his policy of conciliation. The rise of the young Czechs and their extreme demands, which imperiled the Constitution, led him to seek a new alliance with the German Liberals; but they rejected his overtures, and voted with the Feudalists and the Poles against his bill for the extension of the franchise, upon the rejection of which he resigned, Nov. 23, 1893.

Tauchnitz, Baron Christian Bernhard, a German publisher, born in Schleinitz, near Naumburg, in 1816; died in Leipzig, Aug. 14, 1895. He was trained in the establishment of his uncle, the publisher of cheap editions of the classics, and in 1837 set up a printing establishment of his own, printed books for other publishers, and did the public printing for the Saxon Government. He began in 1841 the collection of British authors, which finally embraced 3,000 volumes, and subsequently issued books for the young, French classics, collections of German authors, editions of the Greek and Roman classics, handbooks of logarithms, legal and theological works, editions of the Bible, and dictionaries and manuals of conversation. In 1843 Bernhard Tauchnitz began to enter into arrangements with English authors, whereby he paid them an honorarium and obtained the exclusive authorization to print their books on the Continent, but agreed not to import his editions into England or her colonies, nor to hinder the sale of original English editions on the Continent. After the first international copyright treaty was made between England and the Prussian and Saxon governments, in 1846, his editions were protected by law. He was ennobled by the Duke of Coburg in 1877, and was a member of the Upper Chamber of the Saxon Diet.

Thomson, Joseph, a Scottish traveler, born in Penpont, Dumfriesshire, Feb. 2, 1858; died in York Gate, Aug. 2, 1895. He studied geology at Edinburgh under Sir Archibald Geikie, and at twenty joined Keith Johnson's African expedition. Owing to the death of its leader, Mr. Thomson became the head of the expedition, and the results of this journey appear in his book "To the Central African Lakes and back" (1881). He was at once ranked among the foremost of African explorers, and in 1883 headed an expedition to Masailand. In 1885 he went to Sokoto in behalf of the Royal Niger Company, and his efforts secured the Central Soudan to Great Britain. In 1888 he explored the region of the Atlas mountains in Morocco, and in 1891 the region between Lakes Nyassa and Bangweolo, from which he returned with shattered health. He was a man of great energy and daring as well as a most entertaining writer, and in his journeys was able to avoid all serious conflict with the natives. He was the author of "Through Masai

Land" (1895); "Ulu: An African Romance," with Mrs. H. South (1898); "Travels in the Atlas and Southern Morocco" (1899); and "Life of Mungo Park" (1899).

Thornycroft, Mary, an English artist, born in Thornton, Norfolk, about 1812; died in London, Feb. 1, 1900. She learned sculpture under the instruction of her father, John Francis, married Thomas Thornycroft, a fellow-pupil, and went with him to study in Rome, after exhibiting several works in the Royal Academy. Her most famous work is the "Girl skipping," shown at the Paris Exposition of 1868.

Thorold, Anthony Wilson, an English prelate, born in Farnham, Lincolnshire, June 13, 1825; died in Farnham Castle, Surrey, July 2, 1895. He was the younger son of the Rev. Edward Thorold, vicar of Hougham, Lincolnshire, and was educated at Oxford. His first important charge was that of St. Giles-in-the-Fields, London, where he remained from 1857 to 1867. In 1868 he was minister of Curzon Chapel, Mayfair, and the next year he became vicar of St. Pancras, London, a great parish including congregations of the very rich and the very poor. He was made canon residentiary of York in 1874, and in 1877 was appointed Bishop of Rochester. In 1891 he was translated to the see of Winchester, in which he had the oversight of 553 parishes and more than 800 clergy. He fixed his residence at Farnham Castle, Surrey, a great historical pile much out of repair, but which, from his own resources, he did a great deal to restore and adorn. Bishop Thorold was a frequent visitor to the United States. He was a tireless worker, and possessed great powers of endurance. He was a total abstainer from conviction, and wrote and spoke frequently in defense of his position. In his earlier career he was a Low-churchman, and his evangelical habit of thought was never greatly changed. He contributed frequently to periodicals, and his writings in magazines and in book form were very popular. His published volumes include: "On being Ill" (1865); "The Presence of Christ" (1869); "Parochial Musings" (1873); "The Gospel of Christ" (1881); "The Child of Christ on the Young" (1882); "The Yoke of Christ" (1883); "Questions of Faith" (1892); and "The Tenderness of Christ" (1894).

Troisac, Camilla, an English author, born in 1812; died in Dulwich, Feb. 16, 1895. She began early to write for the magazines, being thrown upon her own resources by the death of her father, who was a solicitor. She was editor of the "Ladies' Companion" and of the "Monthly Magazine" for some years. In 1849 she married Newton Crosland, a London merchant. Most of her subsequent writings pictured the trials and hardships of the poor, and the political and social life of the people. Her books include: "Lays and Legends of English Life"; "Partners for Life"; "Fireside Songs"; "Lydia: A Woman's Book"; and "Landmarks of a Literary Life" (1894).

Troisac, Marie, a Swiss author, born in Vaud in 1812; died near St. Maurice at the end of July, 1895. She was the daughter of a Protestant pastor, and late in life embraced the Roman faith. She wrote under the pen name "Marie," and attained success with a book of "Pictures from Palestine." Of a more enduring reputation are "Un vieux Pays," her "Silhouettes Romandes," and her collection of the folklore of Vaud. Her last book was "Edelweiss" (1894).

Tyrrill, Richard St. John, an English clergyman and author, born about 1828; died in Oxford, Dec. 8, 1895. He was graduated at Oxford in 1849, and ordained two years later. He became vicar of St. Mary Magdalen, Oxford, in 1858, and held that living until 1872, after which he devoted himself to literature and art. His published works include: "Clerical Powers and Duties" (1841); "Schooling of Life" (1844); "Handbook of Pictorial Art" (1848); "Christian Art and Symbolism" (1872); "Our Sketching Club: Lectures and Studies on Landscape Art" (1874); "The Art Teaching of the Primitive Church" (1875); "Hugh Heron, Christ Church: An Oxford Novel" (1880); "Greek and Gothic" (1881); "Natural The-

ology of Natural Beauty" (1882); "Christian Icons and Icons" (1886); "Free Field Lyrics" (1892).

Venables, Edmund, an English architect, born in London in 1813; died there March 2, 1895. He was graduated at Cambridge in 1832, and became curate of Hareton House in 1834 and of Westbury in 1836. In 1837 he was made canon, residentiary and prebendary of Lincoln Cathedral. He wrote much on architecture and archaeology, and was an authority on the history and architecture of his own cathedral. His "Walks through the Streets of Lincoln" was widely popular. His other published works include: "History of Hareton House and Castle" (1834); "History of the Isle of Wight" (1839); "The Church of England: Its Planting, Settlement, Reformation, Renewal and Life" (1846); and "Bunyan" (1866). He also edited "The Private Devotions of Lancelot Andrewes" (1866) and Bunyan's "Pilgrim's Progress" and "Grace Abounding," with notes.

Villiers-Stuart, Henry Windsor, an English author, born in 1827; died in Villiers, Ireland, Oct. 12, 1895. He was educated at University College, Dublin, and was for a time a clergyman of the Establishment, but presently retired. He was vice-lieutenant for County Waterford, 1872-74, and again from 1880 to 1890. He was the author of "Eve of the Deluge" (1851); "Nile Glacings" (1879); "The Funeral Tent of an Egyptian Queen" (1880); "Egypt after the War" (1881); and "Adventures amid Equatorial Forests and Scenery."

Vishnegradsky, Ivan Alexeevich, a Russian statesman, born Jan. 1, 1832; died in St. Petersburg, April 8, 1895. He was a son of the governor of Vladimir-Volotchek, and was educated for a teacher in the Pedagogic Institute. After teaching mathematics in the cadet school in 1851, he was sent to Germany to prepare for a higher post by special studies, and on his return he was appointed Professor of Mathematics in the Artillery Academy. In 1872 he was made director of the Technological Institute. His works books and delivered popular lectures on subjects connected with technical education, and in conjunction with his work as a teacher became a promoter of large industrial enterprises, such as the establishment of powder factories and waterworks, and played an important part in the development of the railroad system of Russia. Alexander III made him a councillor of state in 1880, and in 1895 appointed him Minister of Finance after the dismissal of Sergei Witte. Vishnegradsky succeeded in producing budgets without deficits and brought about an improvement in the Government finances. He began the reconstruction of the Russian loans, purchased railroads for the state, and established an efficient control over the financial administration and the traffic of private railroads, and aided the development of domestic manufactures by the customs tariff of 1891. He retired when entirely broken down by overwork and died in 1895, recommending M. Witte as his successor.

Vogt, Karl, a German biologist, born in Göttingen in 1817; died in Geneva, May 4, 1895. He won a name as a naturalist by his work on entomology with Agassiz and Decey in their travels on Rhine, Moselle, and after pursuing his studies in Paris for two years and visiting Italy he returned to Germany to occupy a chair in the university of his native town. When the revolution of 1848 broke out, and as an ardent democrat he threw himself into the movement. He was chosen member of the Göttingen civil guard, and was elected to the National Assembly at Frankfurt, where he distinguished himself as a brilliant and fiery orator and a thoroughgoing Radical. He went with the rump of the Parliament to Stuttgart, and clung to the National party to the end. His political opinions drove him into exile. He resided for a short time at Zurich, and then went to Nice and took up again his biological researches. A year later he was called to the chair of Zoology in the University of Geneva. He became one of the leaders of the naturalistic school of thought, and published many works, scientific and polemical. He also took an active part in the public

affairs of his adopted country, and was elected to the National and to the Federal Council. Of his published works, the one that made the most stir was "Science and Superstition," a fierce polemic against the interposition of religious authority as a criterion of scientific truth. His "Investigations into Animal Communities" is a caustic satire on the political and social defects of modern civilization. Another controversial work was "Man and his Place in the Creation and the History of the Earth." He wrote also a great work on the "Mammifers," and a widely read "Comparative Anatomy."

Wade, Sir Thomas Francis, an English scholar, born in 1815; died in Cambridge, July 31, 1895. He was educated at Harrow, and entered the army in 1838. A residence of forty years in China, together with his eminent ability, made him a high authority on Chinese topics, and his services in the negotiation of treaties were of great assistance to the furtherance of English trade in the East. He became minister to China and chief superintendent of British trade in 1871, and retired on a pension in 1883. In 1888 he was appointed first Professor of Chinese at Cambridge.

Warren, John Byrnes Leicester, Baron de Tabley, an English poet, born at Tabley House, Knutsford, Cheshire, April 25, 1835; died Nov. 22, 1895. He was educated at Eton and Oxford, and succeeded his father as the third Baron de Tabley in 1887. He was one of the most learned of English poets, but was sensitive and diffident. His writings were by no means so widely known as they deserved to be, but the circle of readers to whom his name was familiar esteemed him as a genuine poet. Perhaps his highest attainment is reached in the serious dramas "Orestes" and "Philoctetes," but all his work reveals, thorough classical sympathies, a delicate, refined taste and great wealth of imagery. His first book, published under the pseudonym John P. Lancaster, was "Præterita" (1863). His subsequent works include: "Eclogues and Monodramas" (1864); "Studies in Verse" (1865); "Philoctetes" (1866); "Orestes" (1867); "A Screw Loose: A Novel" (1868); "Ropes of Sand: A Novel" (1870); "Rehearsals: A Book of Verse" (1870); "Searching the Net: A Book of Verses" (1873); "The Soldier of Fortune: A Tragedy" (1876); "Study of Book Plates" (1880); "Poems: Dramatic and Lyrical" (2d series, 1895).

Williamson, William Crawford, an English naturalist, born in Scarborough, Nov. 24, 1816; died in Clapham, June 23, 1895. His first scientific monograph was published when he was but eighteen. He practiced medicine for many years at Manchester, but during his whole career was constantly engaged in scientific pursuits. Between 1845 and 1847 he published a notable series of papers on the development of fishes' teeth and scales. His most important investigations in later years related to the structure of fossil plants, his "Organization of the Fossil Plants of the Coal Measures" taking high rank as an authority. He became Professor of Natural History and Geology at Owens College in 1851, and held the chair of Botany there until 1892.

Worth, Charles, a French dressmaker, born in Bourne, Litchfieldshire, England, in 1825; died in Paris, March 11, 1895. His father, a solicitor, who had become impoverished by speculation, apprenticed him at the age of thirteen to a dry-goods firm. When his time expired he went to Paris, at the age of twenty, and for twelve years he was employed by a silk house, to whose business he added the branch of making up garments. Having been refused a partnership, he set up an independent business in the Rue de la Paix, having at first M. Dobergh, a Swede, for his partner. He began by employing 50 persons, but when he got the Princess Metternich's custom, and through her that of the Empress Eugénie, and when the fashionable people of Paris, and eventually the wealth and fashions of all the European capitals and of the United States looked to him he employed 1,200. He originated many designs that were universally

adopted, such as the walking dress with short skirt and jacket of the same material.

Zorilla, Manuel Ruiz, a Spanish politician, born in Madrid in 1834; died in Burgos, June 13, 1895. He studied and practiced law in Madrid, and at the age of twenty-two was elected to the Cortes. Very soon he won reputation as an earnest and eloquent champion of the Liberal cause, but in 1860 he was driven into exile, having taken part in the insurrection against Isabella. When the Bourbon throne was overturned in 1868, he returned and presided over the Parliament that offered the crown to the Duke of Aosta in 1870. When Amadeo mounted the throne he made Zorilla his Prime Minister. The King of Italy conferred upon him the order of the Annunziata, usually reserved for royalty. Zorilla earned the gratitude and admiration of the Spanish people by enlarging their liberties and introducing sweeping political reforms; but the development of his plans was interrupted when Amadeo, after a troubled reign of three years, abdicated and went to Portugal, accompanied by the Prime Minister, who, however, soon returned to Spain and embraced republicanism. He sometimes took a conspicuous part in affairs during the interregnum, and became a thoroughgoing republican and a leader of the advanced section of the party. When the Bourbons were restored in 1875 in the person of Alfonso XII, he was sent into exile a second time. He took up his residence in Paris first, and afterward lived in England and Switzerland, and sometimes in the south of France, whence he could communicate easily with his partisans in Spain. He returned to Spain only a few months before he died, renouncing, on account of failing health, any further participation in politics. While Castelar and others renounced violence or accepted the monarchy Zorilla remained a revolutionary republican and schemed and plotted against the monarchy.

OHIO, a Central Western State, admitted to the Union in 1803; population, according to last census (1890), 3,666,719, it being fourth in rank of the States; area, according to the United States Geological Survey, 41,060 square miles, of which 40,760 is land surface and 300 water surface. Capital, Columbus.

Government.—The State officers during 1895 were: Governor, William McKinley, Republican; Lieutenant Governor, Andrew L. Harris; Secretary of State, Samuel L. Taylor; Auditor, Ebenezer W. Poe; Treasurer, William T. Coffey; Board of Public Works, Frank J. McCulloch, Charles E. Groce, Edwin Lybarger; Commissioner of Common Schools, Oscar T. Corson; Judges of the Supreme Court, Franklin J. Dickman until February 9, Thaddeus A. Minshall, Marshall J. Williams, Jacob F. Burkett, William T. Spear, Joseph P. Bradbury, John A. Shauk on Feb. 9; Clerk of the Supreme Court, Josiah B. Allen; Dairy and Food Commissioner, Frederick B. McNeal.

Finances.—The receipts for the fiscal year 1895, including balance from 1894, were \$3,443,383.94, which were used by the following departments and institutions: Board of Public Works, \$105,337.70; Soldiers' and Sailors' Home, from United States, \$92,181.41; Dairy and Food Commissioner, from fines, \$15,403.37; Commissioner of Railroads and Telegraphs, from railroad companies, \$15,355.33; Inspector of Mines, from fines, \$5; total receipts for special purposes, \$231,282.81; grand total for all purposes, including balance, \$4,029,394.60; total disbursements for year ending Nov. 15, 1895, \$3,795,721.22; balance in treasury Nov. 16, 1895, \$233,673.38.

The public funded debt of the State in January, 1892, was \$2,295,665, bearing 3 per cent. interest. The debt on Nov. 15, 1893, was \$1,791,665. This sum includes \$500,000 of a loan by certificate of indebtedness payable July 1, 1896, also bearing 3 per cent. interest, which was authorized by the seventy-first General Assembly. There has been paid on the public debt of the State \$1,000,000 in the past four years. The entire funded debt of the State will be extinguished on July 1, 1900.

Education.—The value of the school property of the State is more than \$40,000,000. The school enumeration in 1893 was 1,159,258. The number of teachers employed during the whole of the school year was 17,380. The number of pupils in attendance was 817,490. The average daily attendance was 593,465. The amount paid teachers was \$7,907,860.71. The number of new schoolhouses erected was 275, at a cost of \$1,246,376. During the year the amount received for school purposes from taxation was \$11,422,331.81; from irreducible school fund and other State school property, \$251,569.06; and from other sources, sales of bonds, etc., \$2,058,981.35; making a total of \$13,733,102.22.

Lynching.—Two cases of attempted lynching occurred in the State during the year, and in both instances the troops were called out to support the law and protect the prisoners in jail against the mob. In Seneca County 2 men were killed before the troops arrived. In Fayette County the troops were acting under orders of the sheriff when the mob assailed the jail. The troops fired, and several persons were killed. In both cases the prisoners were protected and the lynchers driven off. The colonel in charge of the troops was indicted and tried for the killing, but was acquitted on the ground that he was performing his duty.

Mining.—The report of the chief mine inspector, filed in August each year, relates to the year preceding. His report made in 1893 gives the year's production of coal as 11,910,219 tons, a heavy falling off in consequence of labor disputes. Of this amount, 2,555,466 tons were mined by machinery, this method being confined to 9 of the 30 coal-producing counties of the State. The number of persons employed in and about the mines was 31,493, of whom 25,163 were miners. There were 119 new mines opened during the year, 67 remained suspended, and 59 were either exhausted or abandoned. At the close of the fiscal year there were 1,163 mines in the State, of which 1,096 were in operation, which is 39 more than during 1893. Of this number, 411 employ more than 10 men, and 685 fewer. The accidents numbered 257, of which 44 were fatal. There was 1 accident for each 402.43 tons of coal mined; 264,672 tons were mined to each life lost. The iron-ore production was 58,043 tons; fire-clay, 942,913 tons.

Canal Property.—A decision by the Supreme Court, handed down in June, conclusively determines that land occupied and used by the State for canal purposes becomes the property of the State absolutely in fee. In November, 1893, the Attorney-General, acting by direction of a resolution of the General Assembly, instituted proceedings to oust the Pennsylvania Company from occupying with its tracks and depots the

portion of what was formerly the Miami and Erie Canal in Cincinnati, between Broadway and the Ohio river. In deciding the case in favor of the State, the court allowed one hundred and twenty days for the railway company to obtain from the State the right to keep its tracks and depots upon the premises in controversy. Before the time expired, a settlement was effected.

Arbitration.—The State Board of Arbitration, during the two and a half years of its official existence, has been called in deal with 28 strikes and lockouts, of which 15 have been settled wholly or partly through its agency. The board in its report called attention to an important defect in the law and suggested its amendment. Literally interpreted, the statute now makes no provision for services of the board where a controversy arises between employer and employees of any firm, company, or corporation, operating in different counties, where the several employers act together on the one hand and groups of employees on the other.

Military-park Monuments.—The Ohio, Chickamauga, and Chattanooga National Military Park Commission rendered its report to the Governor, showing the completion of its work. It erected 55 monuments to mark the places where Ohio troops fought and died on that historic field. All its liabilities were paid at the time of the report except the cost of publishing the report itself, and without this expenditure there remained a balance in the hands of the treasurer of \$6,494.82.

Hocking Valley Sufferers.—The latest disputes in the Hocking Valley coal mines kept the mines idle during the greater part of 1894, causing such distress that, in January, 1895, the miners were forced to appeal for assistance. Gov. McKinley requested certain cities and villages to give supplies and money to relieve their needs. The response was prompt and generous. A large quantity of provisions and clothing and other needed supplies were shipped from time to time to points where distribution existed, and \$4,948.87 in money subscribed, of which about four fifths were expended. There were 2,722 families assisted. The total value of the supplies, including provisions and clothing, was estimated at \$31,783.

No Legislative Session.—For the second time in the history of the State there was no legislative session during the year. The first Constitution of Ohio, adopted Nov. 28, 1802, provided that the General Assembly should "meet on the first Monday of December in every year." The present Constitution provides that "all regular sessions of the General Assembly shall commence on the first Monday of January annually." This constitutional provision has been only twice observed.

Limited Woman Suffrage.—The law passed in 1894, granting women the right to vote for school officers and to sit on school boards, was decided to be constitutional by the circuit court of Franklin County, and subsequently by the Supreme Court, on the ground that the whole subject of the public schools is delegated to the General Assembly. Women registered and voted in considerable numbers in some municipalities, and some were elected to school boards.

Political.—The Republican State Convention was held in Zanesville May 28 and 29. There was a sharp contest over the nomination for Governor, 8 candidates being voted for. On the sixth ballot Asa S. Bushnell, of Springfield, a wealthy manufacturer of agricultural implements, was nominated. The significance of the nomination lay in the fact that Mr. Bushnell was the avowed choice of the friends of ex-Gov. Foraker, and was opposed by the friends of Gov. McKinley. The contest between the two factions also affected the choice for the other offices. The nominations following that for Governor were made on the second day, and were as follows: For Lieutenant Governor, Asahel W. Jones; Auditor, A. D. Guilbert; Judge of the Supreme Court, Thaddeus A. Minshall; Clerk of the Supreme Court, Josiah B. Allen; Attorney-General, Frank S. Monett; Treasurer, Samuel B. Campbell; Member of the Board of Public Works, E. L. Lybarger. The platform included these declarations:

We reaffirm our adherence to the principles of the Republican party as defined by the national convention in 1892, chief among which are: A protective tariff, reciprocity, fair elections, and honest money, consisting of gold, silver, and paper, every dollar as good as any other dollar, and all backed by the national faith and honor. We favor bimetallicism and demand the use of both gold and silver as standard money, either in accordance with a ratio to be fixed by an international agreement or under such restrictions and provisions as will secure the maintenance of the parity of values of the two metals.

We denounce the present Democratic Administration, whose vicious and vacillating course has brought us distress at home and humiliation abroad. It has inaugurated a policy looking toward ultimate free trade, which has deranged business, crippled our industries, distressed our homes, and dealt labor a serious blow. With deplorable incompetency it has failed to raise revenue enough to run the Government, and has had to borrow in less than two years \$162,000,000, mainly to pay ordinary running expenses, selling in secret to favor foreign syndicates the bonds of the Government at prices far below their actual value. We denounce the present administration of the Pension Bureau for its betrayal of the interests of the Union soldiers.

We indorse the able, honest, and business-like administration of Gov. William McKinley.

The election of a Republican Legislature in this State next November will enable Ohio to send to the United States Senate a Republican colleague to that grand old statesman John Sherman, who has so long and ably sustained the honor of Ohio as her representative in that august body.

The Prohibition Convention was held in Springfield, June 12, and the following ticket was nominated: For Governor, Seth H. Ellis; Lieutenant Governor, J. W. Sharp; Attorney-General, W. C. Bates; Auditor, A. S. Caton; Treasurer, J. H. Hawkins; Judge of the Supreme Court, John T. Moore; Clerk of the Supreme Court, D. F. Spicer; Member of the Board of Public Works, James Benjamin. A choice for United States Senator was expressed for R. S. Thompson. The platform advocated

Suppression of the liquor traffic; woman suffrage; that natural monopolies, such as telegraph and railroads, should be owned by the Government; no monopoly on land; amendment of the Constitution to allow national revenues to be raised by equitable adjustment of taxation on the property and incomes of the people, until which time import duties should

be levied upon luxuries rather than necessities, opposing any appropriations of public moneys for sectarian purposes, and favoring the public schools; election of the President and other officers as far as practicable by the popular vote; proportional minority representation in State and nation. There was also reported a plank on the money question which was voted down and a substitute adopted, declaring that the money of the country should be of a full legal tender, issued directly to the people on ample security in such quantities as the people may demand and all at uniform rate of interest. To this end the Government should establish real national banks, as it does post offices, wherever the convenience of the people demands. Until such financial system can be established we favor the free and unlimited coinage of silver and gold at the ratio of 16 to 1 as a temporary relief.

The People's party held their convention in Columbus, Aug. 2, and nominated the following ticket: For Governor, Jacob S. Coxey; Lieutenant Governor, John H. Crofton; Treasurer, George W. Harper; Auditor, Charles Bonsall; Attorney-General, William Baker (Thomas Reed substituted on Baker's withdrawal); Supreme Judge, E. D. Stark; Member of the Board of Public Works, William A. Gloyd; Clerk of the Supreme Court, Thomas N. Hickman. The choice of the party for United States Senator was also expressed, the nominee being George A. Groot. The platform affirmed

The principles of the Omaha platform; favored Coxey's noninterest-bond and good-road bills; favored the coinage out of paper of as many dollars or units as will be sufficient to conduct the business of the country on a cash basis, and demanded that such money be a full legal tender; favored the free and unlimited coinage of gold and silver into dollars or units at the present legal rates without any regard whatever as to what other nations may do; demanded the nationalization of all public monopolies; denounced as treason to the American people the issue of interest-bearing bonds at any time, either in war or peace; denounced as treason to the Constitution of the United States the subversion of the rights of trial by jury as practiced by the courts in the case of E. V. Debs; favored a law that will make unlawful any bond, note, mortgage, or other obligation that is made payable in gold only, and declared that all debts, public and private, should be made payable in any lawful money of the United States at the option of the debtor; favored the immediate abolishment of the national banking system; maintained that Congress should pass the *per diem* service act demanded by the Grand Army of the Republic, and Congress should provide for the payment to the Union soldiers of the war of 1861 to 1865 such sum as will make their pay equal to coin with interest thereon. It also favored direct legislation by the initiative and referendum in national, State, and local government, the imperative mandate and proportionate representation; the election of all officers in the State and nation by direct vote of the people; eight hours' work and the union label; State control of the liquor traffic without profit.

The Democratic State Convention was held in Springfield, Aug. 21, when the following nominations were made: For Governor, James E. Campbell; Lieutenant Governor, John B. Peaslee; Auditor, James A. Knott; Treasurer, William B. Shober; Judge of the Supreme Court, William T. Mooney; Attorney-General, George A. Fairbanks; Member of the Board of Public Works, J. W. Cruikshank (Harry B. Keffer substituted on Cruikshank's withdrawal). The nomination for Governor was made by acclamation,

there being no other candidate named. The platform included the following declarations:

When we consider the fact that the Democratic party incurred from the Republicans in 1892 a bankruptcy, Yemorey, that it inherited from them the vicious currency and tariff laws which had prepared and finally produced the panic of 1893, we insist that it is entitled to the thanks of the people for the courage with which it has attacked and repudiated these laws.

We hold to the use of both gold and silver as the standard money of the country and to coin of both gold and silver, without discriminating against either metal or charge of mintage; but the dollar unit of weight of both metals must be of equal intrinsic and exchangeable value; or be adjusted by international agreement, or by such safeguards of legislation as shall insure the maintenance of the parity of the two metals and the equal power of every dollar at all times in the payment of debts, and we demand that the paper currency shall be kept at par with and responsible in such coin.

We call the attention of the people to the methods and practices of boomerism by which the Republican party in this State has been managed in the last few years.

We denounce the last Legislature as corrupt and unworthy of the confidence of the people.

A minority report substituted for the money plank a resolution calling for free coinage of silver at the ratio of 16 to 1, and that the United States wait for neither England nor any other nation to enter into an international agreement respecting the coinage of silver. The minority resolution was defeated by 270 yeas to 538 nays. An additional resolution was unanimously adopted, after some confusion, without being referred to the committee. It reads:

We view with alarm the armed invasion by Great Britain of one of the republics of this continent under a claim of right for the collection of a petty debt by means of claiming ownership and exercising jurisdiction over American soil belonging to our sister republic of Venezuela. The British Government has manifestly been disregarded and defied the policy of this Government as announced by President Monroe in 1823, and ever since adhered to, which should create the gravest apprehension in the minds of all patriotic Americans and call for the prompt and energetic demand on the part of our Government that the Monroe Doctrine must and shall be respected and observed.

The Socialist-Labor party also put a partial ticket in the field, as follows: For Governor, William Watkins; Lieutenant Governor, Wm. E. Krumm; Auditor, Daniel Wallace; Treasurer, George T. Brewster; Member of the Board of Public Works, John Schuch; Clerk of the Supreme Court, Charles Odendahl.

The election was held Nov. 5, and resulted in a sweeping victory for the Republican candidates, Mr. Bushnell for Governor having a plurality of 92,622 and a majority over all of 16,813. The vote on Governor was: Asa S. Bushnell, Republican, 427,141; James E. Campbell, Democrat, 334,519; Jacob S. Coxey, Populist, 22,678; Seth H. Ellis, Prohibitionist, 21,264; William Watkins, Socialist-Labor, 1,867; scattering, 3. The total vote for Governor was 227,469, and the total vote cast in the State 246,996. The other successful candidates, all Republican, with the pluralities of each, were as follow: Lieutenant Governor, Asahel W. Jones, 94,350; Auditor, Walter D. Guilbert, 98,067; Treasurer, Samuel B. Campbell, 98,

497; Attorney-General, Frank S. Menden, 99,253; Judge of the Supreme Court, Thaddeus A. Mitchell, 98,889; Member of the Board of Public Works, Edwin L. Lybarger, 99,256; Clerk of the Supreme Court, Joseph B. Allen, 99,461. Members elected to the twenty-second General Assembly were: Senate, 31 Republicans, 6 Democrats; House, 89 Republicans, 25 Democrats.

OKLAHOMA, a Western Territory of the United States, organized in 1906. Population, according to the Auditor's census of Feb. 1, 1904, 212,625. The increase at the close of the fiscal year June 30, 1903, is account with the Interior Department, was estimated to be 62,265; area, 26,813 square miles, or, according to recommendation of the Dawes Commission for statehood, 41,000 square miles.

Government.—The Territorial officers for the year were: Governor, William C. Bushnell, Democrat; Secretary, Thomas J. Lowe; Attorney-General, C. A. Gallwey; Treasurers, J. E. Turner; Auditor, E. D. Cameron; Secretary of the Board of School-land Leases, William Hincose; Inspector General of Mills, James H. Hewitt; Chief Justice, Francis Dale; Associates, Henry W. Scott, Justice Barford, and Justice Bierer; Secretary of the Pharmaceutical Board, Edwin De Barr; Superintendent of the Board of Health, Dr. C. D. Arnold.

Finances.—The Auditor's report for the biennial period gives: Cash on hand, \$7,394,429; collections ending Nov. 20, 1904, \$198,797.84; disbursements, \$185,142.89. The general fund warrant indebtedness was \$86,681.24.

Assessments.—The Territorial tax was 40 mills on \$1 for the following divisions: General revenue, 3 mills; university, normal school, and interest on outstanding bonds, 9½ of a mill each; and 0-1 of a mill for the use of the Board of Education. General fund warrants, less cash in the treasury, was \$160,000. The levy of 3 mills on \$1 for general fund gave \$117,825. Taxes were small, on account of time extension allowed by the Legislature from April until the first Monday of August. The amount of taxes due in November was computed to be \$59,773.43. The proceeds from the sale of the outstanding 6-per-cent. school bonds, amounting to \$45,000, were used to meet university, normal-school, and Agricultural and Mechanical College buildings.

The taxable property, as equalized for 1905, shows an increase for the year from \$10,941,222 to \$12,275,180, because patents for claims have brought them under legal valuation.

Legislative Session.—The Assembly convened on Jan. 8, 1905, in the university building. The Council was Republican, with the exception of 4 Populists and 1 Democrat, with John H. Pitzer as president. The House was composed of 16 Republicans, 7 Populists, and 4 Democrats, with Cassius M. Barnes as chairman. The Legislature adjourned March 15, after passing 118 bills, of which 6 were not signed by the Governor. The bills that became laws included the following:

Authorizing bond issues by counties, cities, and corporations on warrant indebtedness.
Providing for inspection of wells.
Providing for school ownership debts.
Assessing personal income to tax credit to districts.

For government of land leases.
 Relating to roads.
 To establish a fiscal agency in New York.
 For organization of the militia.
 Relating to debts fraudulently contracted.
 Legalizing the Perry Board of Education.
 Providing for renewal of registered deeds destroyed by fire.
 Relating to pharmacy.
 Providing for assessment of railways and their property.
 For bridge over South Canadian river.
 To protect live stock.
 Creating a soldiers' home at Fort Supply, subject to Government cession.
 Legalizing all incorporated cities.
 To protect stock raisers.
 Keeley Cure Institute bill.
 For protection of fish and game, permitting the killing of game between Nov. 1 and Feb. 1, and forbidding the shipment of game, or its killing, in cities.
 Giving the right to prefer creditors.
 For memorial to Congress for free homes for strip settlers; and one as to time for first payments in reservations.

Relating to settlers driven from Wichita reservation by Indian agent.
 Creating an Historical Society at the university.
 Requiring registry of births of animals.
 For grading of high schools.
 Repealing the usury law, and providing 7 per cent. as contract interest.
 Asking Congress to admit Oklahoma to statehood with New Mexico and Arizona.
 Amending the alien law.
 Regarding perpetual plan in stocks of building and loan associations.

Providing for a board of commissioners for the promotion of legislative uniformity in laws in the various States of the Union.

Giving preference to old soldiers and sailors in the employment of persons in public service.

Joint memorial to Congress for appropriation of \$50,000 for purchase of seeds for the Cherokee strip.

The Insane.—The care of the insane was provided for by the third Assembly, enabling the Governor to contract with the incorporated Oklahoma Sanitarium Company owning Highgate College, at Norman, for their care for three years, and for removal from Jacksonville, Ill., of patients there. The sanitarium opened on June 15 and received 34 patients. In November 77 had been received and 10 discharged as cured. The cost for the maintenance of each patient under contract is \$300.

Educational.—The university, at Norman, had an enrollment of 186 students and an average attendance of 160. The university receives $\frac{1}{4}$ mill for its support and an endowment from the United States Government, and its tuition is free. It has received additions to its equipment during the year. The State Historical Society, founded by the Press Association, has a room in the building and owns complete files of papers.

The Normal School, at Edmond, provided a literary, business, and academic training for 101 pupils during the year without fees of any kind. Its support is provided for by the $\frac{1}{4}$ -mill tax, income from reserved school lands, and appropriations. A colored normal school is being provided for at Edmond. The Board of Regents let the contract in August for the completion of the south wing.

The Agricultural and Mechanical College, at Stillwater, occupied for the first time its new building. The year opened with 104 pupils.

For the first time all the regular college classes were represented and a smaller preparatory class for the winter term was presented. No tuition or incidental fees are required, the expenses being met by an endowment from the United States and one third of the proceeds from Cherokee Outlet Section 13.

The public schools of the Territory had a total attendance during the year of 77,770. The total apportionment was \$54,665.65, derived from school-land leases, about 69 cents *per capita*. Stillwater is erecting a new school building, to cost \$12,000.

School Lands.—In December only 10 per cent. of notes for 1895 were delinquent, and the department was receiving about \$3,000 a day from leases. To July 1 \$40,000 had been received. At the beginning of the year 1,950 quarter sections were leased and 4,244 vacant. West of Range 14 a Texan syndicate leased 300,000 acres of 552 sections. The proceeds from these leases amount to \$13,355.12 for public buildings; for colleges, \$13,703.03.

Railways.—The total valuation of railway property as assessed for 1895 was \$2,431,092.46. Oklahoma had 4 lines in operation at the close of the year—the Atchison, Topeka and Santa Fé and the Chicago, Rock Island and Pacific, which run through the Territory from north to south; the Choctaw, Oklahoma and Gulf Railway, which runs from El Reno eastward into Arkansas; and the Kiowa, Topeka and Santa Fé, which runs through the northwestern part of the Territory—making an aggregate mileage for the year of 463 miles. The Choctaw, Oklahoma and Gulf Company has built and equipped its road as far as Wistar Junction.

Banks.—There are 57 banks in the Territory. Reports from 24 banks give an aggregate capital stock of \$546,000, with \$87,000 as surplus and undivided profits; deposits, \$1,302,000; loans and discounts, \$826,000; securities, \$190,000; cash and sight exchanges, \$465,000.

Indians.—Only 1 Indian reservation, that of the Kickapoo tribe, was opened to settlement in May. One hundred thousand acres of the Kickapoo land were selected as indemnity school land for loss of school land in the Osage reservation, leaving a small tract over 2 townships for homestead entry. Nearly half of the school land is leased and new leases are being made rapidly.

In the Osage treaty the word "Osage" was omitted, and the tribe claims that the \$700,000 trust fund was intended for their own civilization and not for tribes in general.

Mining.—Although Congress has declared the soil of Oklahoma not minnerally productive, rich specimens of gold ore were found in the Wichita mountains in 1895, and also near Woodward in April and October. Other indications of valuable deposits have also been discovered. Coal and petroleum were found at Stillwater, anthracite east of Payne County, limestone in Perkins, gypsum in many directions, and sandstone and brick clay in various localities.

Agriculture.—The cotton crop for the year was expected to bring \$115,000. Early in the season 2,318 bales had been marketed at Guthrie.

Climate.—The average rainfall for August was 5.07 inches, 1.90 daily, above the normal; greatest monthly rainfall, 8.30 inches at Keokuk.

Falls; least, 2-10 at Fort Sill; greatest daily, 380 inches at Alva.

Statchool.—A mass meeting calling a convention to memorialize Congress regarding the admission of Oklahoma to statchool was held in Shawnee in December. The Assembly passed a bill for the same purpose, and several bills were introduced in Congress for that object during the year.

OLEOMARGARINE. The act of Congress of Aug. 5, 1886, entitled "An Act defining butter, also imposing a tax upon and regulating the manufacture, sale, importation, and exportation of oleomargarine," went into effect Oct. 31, 1886. It defined "butter" as the food product usually known as butter, made exclusively from milk or cream, or both, with or without common salt, and with or without additional coloring matter; and under the term "oleomargarine" it designated "All substances heretofore known as oleomargarine, oleo, oleomargarine oil, butterine, lardine, oleo, and neutral; all mixtures and compounds of oleomargarine, oleo, oleomargarine oil, butterine, lardine, suine, and neutral; all lard extracted from tallow extracts; and all mixtures and compounds of tallow, beef fat, suet, lard, lard oil, vegetable oil, annatto, and other coloring matter, intestinal fat, and offal fat made in imitation or semblance of butter, or, when so made, adulterated or intended to be sold as butter or for butter." An internal-revenue tax of 2 cents a pound is imposed on the article, to be paid by the manufacturer. Manufacturers must also pay a special tax, popularly called a license, of \$600 a year; wholesale dealers, \$480; and retail dealers, \$48. Manufacturers are required to give bonds, file inventories, keep books, and make monthly returns to the Commissioner of Internal Revenue, showing the quantity of oleomargarine produced and sold, and to whom sold, and the materials used in the manufacture. Wholesale dealers are also required to keep books and make returns. Oleomargarine may be removed from the manufactory for export to a foreign country without payment of the tax. Imported oleomargarine is required to pay an internal-revenue tax of 15 cents a pound in addition to import duties. This tax is prohibitory, and none is imported.

The difference between fresh, genuine, un-mixed butter and oleomargarine, which is always made in whole or in part of melted fats, can be detected by a microscope with the aid of polarized light, and with or without the use of a selenite plate. Microscopes are furnished to internal-revenue officers for use in determining whether articles sold as butter should be taxed as oleomargarine. A chemical analysis affords more conclusive proof than a microscopic test, and is resorted to in case of doubt.

Oleomargarine must be packed by manufacturers in packages containing not less than 10 pounds each, and marked, stamped, and branded as the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, may prescribe. Sales made by manufacturers and wholesale dealers must be in original stamped packages. The payment of the taxes imposed by the United States law does not authorize a person to engage in the manufacture or sale in disregard of State laws. Some States have passed

laws prohibiting its manufacture and sale, which have been held by the courts to be unconstitutional as a valid exercise of the police power.

The number of factories in the United States producing oleomargarine in 1885 was 21, and there were 243 wholesale dealers and 3,972 retail dealers. In 1894 there were 23 factories, 279 wholesale dealers, and 7,524 retail dealers.

Of oleomargarine 56,956,105 pounds were manufactured during the year ended June 30, 1895, a decrease from the preceding year of 12,664,143 pounds. The following figures show last year's production by States: Illinois, 31,302,871 pounds; Rhode Island, 9,023,202; Kansas, 7,199,025; Ohio, 3,372,491; Nebraska, 3,090,000; Missouri, 1,013,544; Indiana, 653,263; Pennsylvania, 603,112; California, 223,289.

For export, 3,227,498 pounds were withdrawn from the factories.

The following figures show the production in this country for each fiscal year since the law went into effect: On hand Nov. 1, 1886, 187,000 pounds. During the fiscal year ended June 30: In 1887 (from Nov. 1, 1886), 21,312,327 pounds; in 1888, 34,223,327; in 1889, 25,664,696; in 1890, 32,324,072; in 1891, 44,892,939; in 1892, 48,383,155; in 1893, 67,224,299; in 1894, 69,621,346; in 1895, 56,956,105; total, 410,569,425 pounds.

The following table shows the internal-revenue receipts from oleomargarine since for the two years ended June 30, 1894, and 1895:

RECEIPTS.	1894.	1895.
Tax on oleomargarine	\$1,721,504 36	\$1,606,391 45
Manufacturers of oleomargarine (special tax)	11,208 00	1,078 00
Retail dealers in oleomargarine (special tax)	258,877 34	264,198 75
Wholesale dealers in oleomargarine (special tax)	107,264 00	107,264 00
Total	\$1,798,853 66	\$1,980,932 20

The following figures show the oleomargarine receipts from all sources for each fiscal year since the law went into effect: Year ended June 30, 1887 (from Nov. 1, 1886), \$723,049.64; in 1888, \$864,139.88; in 1889, \$964,247.34; in 1890, \$1,098,291.72; in 1891, \$1,077,504.14; in 1892, \$1,200,326; in 1893, \$1,670,643.50; in 1894, \$1,721,504.36; in 1895, \$1,606,391.45; total, \$10,418,212.27.

ONTARIO, a province of the Dominion of Canada.

Government.—There was no change in the Government during the year, and Sir Oliver Mowat's Cabinet, over the varied personalities of which he has presided since 1872, consisted of himself as Attorney-General; Hon. A. S. Dand, Commissioner of Crown Lands; Hon. J. M. Gillson, Provincial Secretary; Hon. G. W. Ross, Minister of Education; Hon. R. Harcourt, Provincial Treasurer; Hon. J. Dryden, Minister of Agriculture; Hon. W. Harris, Minister of Public Works; Hon. E. H. Brown, minister without portfolio.

Finances.—Mr. Harcourt delivered his budget speech on Feb. 28. He pointed out that the actual receipts during the year ending Dec. 31 were \$2,422,162, or \$208,290 more than had been estimated. From the Crown Lands Department \$1,037,532 had been received, mainly from the sale of license of timber lands. The expendi-

ture was \$3,839,338, compared with \$3,907,145 in 1893, \$4,068,257 in 1892, and \$4,158,459 in 1891. Civil government, legislation, education, agriculture, justice, hospitals, charities, and colonization roads had all cost more than in the preceding year; but \$116,000 less had been expended on public buildings. He referred to the expenditure within a few years of \$1,356,997 for new asylums, and to the fact that in 1894 there were 4,441 inmates of the 7 Ontario asylums. Public institutions of this and similar kinds had cost for maintenance during the year \$756,984. Dealing with official salaries, he made an interesting comparison with those paid in New York State, which showed that the latter were more than double the amount of the remuneration paid by Ontario for the same work.

The chief items of the receipts for the year were: The Dominion subsidy and special grant, \$1,196,872; the interest on capital held and debts due by the Dominion to Ontario, \$310,020; from woods and forests, \$980,497; liquor licenses, \$277,330; law stamps, \$84,097; brewers' licenses, \$54,920; drainage debentures, \$793,000. The principal heads of expenditure were as follow: Civil government, \$240,474; legislation, \$142,962; administration of justice, \$418,746; education, \$684,559; public institutions, \$756,983; agriculture, \$181,064; hospitals and charities, \$182,692; colonization roads, \$116,879; public buildings, repairs, etc., \$71,548; charges on Crown lands, \$111,158; aid to railways, \$147,516; asylums, etc., \$341,062.

Mr. Harcourt then dealt with the assets and liabilities of the province. Deducting liabilities presently payable, and excluding money borrowed upon annuities and payable in future yearly installments, and payments pledged to railways, which together amount to several millions, he claimed a surplus of assets amounting to \$5,269,840. The estimated revenue for 1896 was \$3,149,372; the estimated expenditure, \$3,401,905.

Legislation.—The first session of the eighth Legislature was opened in Toronto, Feb. 21, 1895, by Lient.-Gov. George A. Kirkpatrick. The following are the more important paragraphs in his speech from the throne:

Increased interest has been taken in improved methods of farming and in the reports and publications of the Department of Agriculture. Various agricultural associations and organizations have been making increased demands for instructors. The special dairy work in connection with the agricultural college at Guelph has been prosecuted with very satisfactory results, and last year proved the most successful in the history of the college.

From time to time public attention has been directed to our northern districts as suitable for settlement by an agricultural population. At the present time considerable interest is being manifested in this direction, and it is proposed to establish, with your approval, at a moderate expense, a pioneer dairy farm to attract further attention to these new districts, and also to prove their adaptability to agriculture.

During the past year the Rainy lake region has shown little notice as a gold field. Many explorers have been attracted to it, and promising locations have been taken up and partially developed.

The Supreme Court of Canada having held that the province has no power to pass a prohibitory liquor law, my Government is taking the necessary proceedings for an appeal to her Majesty's Privy Council upon this question.

Since the last session the main building of the Brockville asylum has been completed, and patients were admitted before the end of the year.

The total expenditures of the province were kept well within the appropriations, and the actual receipts were considerably in excess of the estimate.

Mr. W. D. Balfour was elected Speaker, and after a session of considerable interest the Assembly was prorogued. The principal measures passed were as follow:

Several acts incorporating electric and steam railway companies.

Respecting the agreement between the city of Stratford and the Grand Trunk Railway.

To incorporate the Algoma Dry Dock Company.

To incorporate the Sault Ste. Marie Pulp and Paper Company.

To authorize the town of Carleton Place to issue certain debentures.

To incorporate the town of Sturgeon Falls.

To incorporate the city of Chatham.

To revive the act incorporating the Sarnia and Lambton Southern Railway Company.

Respecting the verdict of jurors in civil cases in the high courts and county courts.

Respecting benevolent, provident, and other societies.

For the further protection of children.

To amend the municipal light and heat act.

To amend the act respecting line fences.

To amend the cemetery company's act.

Respecting the election laws.

Relating to leases, sales, and mortgages of settled estates.

Respecting dower in mortgaged and other property.

To make better provision for the widows of intestates in certain cases.

For diminishing appeals and otherwise improving the procedure of the courts.

Respecting municipal arbitrations.

To consolidate and amend the agriculture and arbor acts.

For the prevention of fraud in the sale of fruit.

To amend the act to provide for the admission of women to the study and practice of the law.

To make further provision respecting assignments for the benefit of creditors.

To make further provision for the public health.

For the relief of cheese and butter manufacturing associations.

To amend the Ontario game protection act.

To amend the insurance law.

Respecting the medical tariff.

Political.—Although the provincial elections of 1894 had given Sir Oliver Mowat's government a majority, the elements were so much mixed that it was impossible to say how small that majority might be until the House had met. The Patrons or farmer's party numbered at least 14, the Conservatives 24, and the Protestant Protective Association or extreme Protestants 3, against 51 straight Liberals. It was soon found that more of the Patrons voted with the Liberals, the result being a majority varying from 37 to 18.

One of the first questions to come up was the expense of Government House and its maintenance. After a long discussion, in which Sir Oliver Mowat plainly showed his indisposition to take any radical steps, it was decided, on a nonparty vote, that "a select committee of this House be appointed to consider all questions relating to Government House and its future maintenance by the province." The decision could not affect the position of the Lieutenant

Governor, except to make it necessary for him to live upon his Dominion salary of \$10,000 instead of having expenses up to \$15,000 a year allowed by the province in addition.

One of the questions during the election had been the opposition claim that provincial officials were so many partisan machines; that their fees were too large; and that some other method of appointment or selection should be found. On March 20 it was moved that

In the opinion of this House, the present mode of appointing registrars of deeds and other county officials is unsatisfactory and should be changed; and that the appointment of all the said officials whose salary or remuneration is provided in whole or in part by the localities for which they are appointed should not be vested in the executive of the province, but in the municipalities.

The Premier strongly opposed the motion and any approach toward elective officials, in this agreeing with his Conservative opponents in Dominion matters, and the motion was lost by 36 to 25.

During the session Sir Oliver introduced and carried an important law-reform bill. It changed the composition of the High Court of Ontario, and provided that in cases where the amount at issue is not greater than \$1,000, or which did not come under a special and specified class, an appeal may be taken directly to the Divisional Court, from which no appeal may be taken to the Court of Appeal. In cases that are over \$1,000 and not included in the specified exceptions appeal is optional to either the Divisional High Court or the Court of Appeal. If the appellant choose the former he has no option of a further appeal to the latter. The intention was to transfer some of the business now going in the Court of Appeal to the High Court.

Fees Commission.—During the session the Fees Commission reported. The result of the investigations, which fill a bulky volume, is a strong condemnation of elective officials. The conclusions are summarized as follow:

No change should be made in appointing the officers by handing over the choice to local authorities. The fee system should be continued as to all administrative officers—registrars of deeds, clerks and registrars of courts, sheriffs, and bailiffs. Salaries should be paid to all judicial or quasi-judicial officers. The expenses connected with clerical and other assistance in the offices should be systematized so that uniformity and not diversity may characterize the service. A limit should be placed upon the receipts of fee-paid officers, to be fixed by the Legislature.

Immigration.—The report of the Provincial Department shows that in 1894 Ontario received 5,968 immigrants, a decrease of 603 from the preceding year. The report refers to their occupations, and regrets that a comparatively small number of farm laborers come to the country, the demand always exceeding the supply. It adds that the prevailing rate of wages was slightly lower than in 1893 and the expenditure on immigration account was \$8,140, against \$6,974 in 1893.

Agriculture.—This is the chief industry and occupation of Ontario. In 1894 there were 8,327,153 acres devoted to staple field crops, 2,702,241 acres to pasture, 198,968 to orchard and garden; a total of 11,229,362 acres, in comparison with 7,740,073 in 1883. The area, prod-

uct, and value of the chief crops in 1894 were as follow:

CROP.	Area.	Quantity.	Value.
Full wheat	775,982	14,514,382	\$4,900,000
Spring wheat	280,000	4,900,000	1,400,000
Barley	600,000	20,000,000	2,400,000
Oats	2,000,000	10,000,000	1,000,000
Rye	100,000	1,000,000	100,000
Peas	100,000	1,000,000	100,000
Black wheat	100,000	1,000,000	100,000
Flax	100,000	1,000,000	100,000
Potatoes	100,000	1,000,000	100,000
Mangel-worms	100,000	1,000,000	100,000
Carrots	100,000	1,000,000	100,000
Turnips	100,000	1,000,000	100,000
Hay and clover	2,000,000	20,000,000	2,000,000
Corn	100,000	1,000,000	100,000

The horses in the province on July 1, 1894, numbered 674,777, valued at \$46,245,614, compared with 689,814 in 1892, valued at \$53,812,908. The number of cattle was not greatly changed in the two years, being in 1894 2,899,391 head, valued at \$47,577,287. There were also 2,012,865 sheep, worth \$5,606,671; 1,142,128 pigs, worth \$6,009,262; and 7,252,662 poultry, worth \$2,208,518. The value of the live stock sold or slaughtered during the year ending June 30, 1894, is placed by the Bureau of Industries at \$21,203,589. The wool clip was 6,223,008 pounds, valued at \$1,053,721. There were 1,011 cheese factories in operation in 1894, an increase of 114 over 1893. The total output was 11,117,926 pounds greater than in 1893, and the money received was \$1,102,528 in excess. The total amount paid to patrons was \$7,931,922, and the gross value of the cheese (\$7,284,547 pounds) was \$9,441,347. During the year there was a decline in the total value of farm properties in the province of \$13,965,562.

Prohibition.—On Jan. 15, 1895, the Supreme Court of Canada gave judgment in a case referred to it by the Governor General in Council, and involving the question whether the provincial legislatures have the power to prohibit the liquor traffic. Ontario had lately declared in favor of prohibition by a large popular vote. The Supreme Court answered the propositions presented to it as follow:

1. Has a provincial legislature power to prohibit the sale within the province of intoxicating liquors? No.
2. Has the legislature such jurisdiction regarding such portions of the province as to which the Canada temperance act is not in operation? No.
3. Has the provincial legislature jurisdiction to prohibit the manufacture of such liquors within the province? No.
4. Has the legislature jurisdiction to prohibit the importation of such liquors into the province? No.
5. If the legislature has not the jurisdiction to prohibit the sale of such liquors, irrespective of quantities, have they the power to prohibit the retail sale? No—the Chief Justice and Judge Foster dissenting.
6. If the local legislature has a limited jurisdiction only so regards the prohibition of sale, has it jurisdiction to prohibit sales subject to the limits provided by the local act? No.
7. Has the Ontario Legislature jurisdiction to enact the local option act? No—the Chief Justice and Judge Foster dissenting.

An appeal was taken in the Judicial Committee of the Imperial Privy Council, and this judgment in the main was upheld. The royal commission appointed by the Dominion Gov-

ernment to inquire into the question has reported strongly against prohibition, the House of Commons having previously voted in favor of its being dealt with by the provinces.

Minerals.—A statement issued by the Bureau of Mines gives the figures of the mining industry during 1894, which seems, like everything else, to have been depressed. It shows the number of patents issued as 40, in comparison with 63 in 1893; the leases 66, against 122; the revenue from leases, sales, and rentals as \$17,942, against \$26,167 in the previous years. The total value of the mineral product during the year, estimated at the point of production, was \$6,088,758, or \$31,095 less than in 1893. The people engaged in the industry numbered 6,075, and the wages paid were \$1,840,389. Compared with the previous year, the people employed were reduced by 1,100, and the wages paid by \$100,000.

The nickel and copper industries made good progress, the production of the former being equal to 2,570 tons, and of the latter 2,748 tons of metal, compared with 1,642 and 1,431 tons, respectively, in 1893. The production of gold was \$32,960, or about the same as in 1893.

Statistics of Crime.—There was an increase of 831 committals over 1893, half of which arose from petty larceny, trespass, and burglary. The average cost per prisoner was a little less than 14 cents a day. The inspector, in his annual report, dwells upon the decrease in the number of professional tramps, and the success of strict discipline and compulsory work in jails in dealing with this class.

Loan Companies.—The report for 1894 shows 80 companies doing business in lending money on mortgages of real estate. They had a subscribed capital of \$94,047,711, with liabilities to stockholders of \$50,582,921; deposits from the public of \$18,352,607; debentures payable in Canada, \$9,789,709, and payable elsewhere, \$51,014,592. Their loans on real estate aggregated \$115,000,000.

Education.—The school system is under the control of the Minister of Education, and the schools are undenominational, although the Roman Catholics are allowed separate schools under the terms of confederation. Education between the ages of seven and thirteen is compulsory for not less than one hundred days in the year, but the law is not very rigorously enforced. The figures of the Education Department for the year 1894 are as follows:

ITEMS	Public.	Separate.	Hgh.
Number of schools.....	5,649	828	129
Pupils.....	443,441	89,702	23,055
Teachers.....	8,110	714	554
Expenditure.....	\$4,580,115	\$392,392	\$740,651
Expenditure.....	\$2,016,924	\$37,307	\$68,532
Average salaries (male).....	421	351	924
Average salaries (female).....	300	201	

Miscellaneous.—The chattel mortgages in the province increased during the past five years by 5,545. There were 11,687 in number, valued at \$3,446,834, charged against farmers in 1894, and 10,972, amounting to \$7,773,321, against other classes. The rates of wages to farm laborers averaged \$156 (with board) and \$247 (without board), against \$160 and \$255, respectively, in 1890; domestic servants, \$6.23 a month,

against \$6.47 in 1893 and \$6.21 in 1892. The tonnage of the vessels engaged in the coasting or lake trade of Ontario was 11,209,718 in 1894, compared with 9,832,803 tons in the preceding year.

OREGON, a Pacific coast State, admitted to the Union Feb. 14, 1859; area, 96,030 square miles. The population was 13,294 in 1850; 52,465 in 1860; 90,923 in 1870; 174,768 in 1880; 313,767 in 1890. By the State census of 1895 it was 362,762. Capital, Salem.

Government.—The following were the State officers during the year: Governor, William P. Lord; Secretary of State, Harrison R. Kincaid; Treasurer, Philip Metschan; Attorney-General, C. M. Idleman; Adjutant General, R. W. Mitchell, who resigned and was succeeded in April by B. B. Tuttle; Superintendent of Public Instruction, George M. Irwin—all Republicans; Fish and Game Protector, H. D. McGuire; Railroad Commissioners, H. B. Compson, I. A. Macrum, James B. Eddy; Pilot Commissioners, John F. Brown, B. F. Packard, John Fox; Chief Justice of the Supreme Court, Robert S. Bean; Associate Justices, Frank A. Moore, Charles E. Wolverton—all Republicans.

State Census.—The census taken in 1895 gives the following results for the counties:

COUNTY.	Males.	Females.	Total.	Voters.
Baker.....	3,890	2,671	6,061
Benton.....	3,315	2,977	6,292	1,900
Clackamas.....	11,794	9,459	21,253	5,591
Clatsop.....	11,108	8,550
Columbia.....	3,657	2,233	5,890	1,739
Coos.....	4,836	3,654	8,490	2,281
Crook.....	1,907	1,305	3,212	1,300
Curry.....	1,916	667
Douglas.....	7,988	6,571	14,559
Gilliam.....	1,722	1,264	3,016	960
Grant.....	2,649	1,689	4,338	1,440
Harney.....	1,526	99	2,465	770
Jackson.....	7,098	5,910	13,017	8,877
Josephine.....	3,451	2,550	6,001	1,850
Klamath.....	2,318	769
Lake.....	1,316	881	2,197	784
Lane.....	9,402	8,108	17,510	4,990
Lincoln.....	1,777	1,527	3,304	1,000
Linn.....	9,456	8,550	18,066	5,316
Malheur.....	1,539	1,100	2,638	952
Marion.....	16,796	13,245	30,041	7,740
Morrow.....	1,885	1,522	3,407	1,060
Multnomah.....	35,826	37,624	73,550	21,465
Polk.....	4,886	4,307	9,193	2,440
Sherman.....	2,490	921
Tillamook.....	2,182	1,672	3,854	1,116
Umatilla.....	6,963	5,598	12,561
Union.....	6,097	4,768	10,865	3,266
Wallowa.....	2,190	1,791	3,981	1,174
Wasco.....	5,887	4,562	10,449	3,239
Washington.....	8,250	7,112	15,362	4,044
Yamhill.....	7,120	6,948	14,068	4,083
Total for the State.....	362,762

Eleven counties show a decrease since 1890; of these, 10 are in eastern Oregon—east of the Cascade mountains. Coos, the only one in western Oregon that has not increased, shows a loss of 384. The greatest increase is in Multnomah County, amounting to 18,066. Clackamas County shows the largest percentage of increase, having advanced from 15,233 to 21,253.

The population of Portland is 81,342; that of Salem, 10,261.

Other statistics given by the census were: Whole number of acres cultivated, 1,840,911; bushels of wheat, 12,684,412; of corn, 325,714; of oats, 6,645,812; of barley and rye, 1,425,719;

of potatoes, 2,777,596; of plums, pears, and prunes, 295,431; number of sheep, 2,388,011; of hogs, 189,404; of horses, 193,373; of cattle, 406,437; number of pounds of wool, 12,359,753; of hops, 15,626,555; of butter and cheese, 5,626,457; number of tons of hay, 746,613; number of feet of lumber sold, 362,182,318; number of bushels of apples, 1,045,919.

Valuations.—The returns from the State Board of Equalization show a discrepancy from the census returns in many particulars. The difference in the numbers of domestic animals is, perhaps, accounted for by the fact that animals under a given age are not assessed for taxation. The taxable wealth of the State is summarized as follows: Railroad land, \$1,387,318; wagon-road land, \$702,447; unimproved land, \$19,913,147; cultivated land, \$34,046,622; railroads, \$5,125,182; telephone and telegraph, \$192,814; horses and mules, \$2,808,237; cattle, \$3,050,924; sheep and goats, \$1,724,685; swine, \$274,896; town and city lots, \$38,856,388; improvements on lots, \$16,338,741; improvements on deeded lands, \$6,078,178; money, \$1,551,800; notes and accounts, \$9,057,432; shares of stock, \$1,818,072; improvements on deeded lands, \$591,453; household furniture, etc., \$3,743,584; machinery and equipments, \$1,522,565; merchandise and implements, \$8,894,752; rolling stock of railroads, \$628,174; total value of all property as returned by counties, \$158,819,730. The gross amount, as equalized, is \$153,967,177; total exemptions, \$8,621,751; net taxable, upon which the State levy will be made, \$144,445,426. The rate of taxation for 1896 is 4-8 mills for the general fund.

Education.—Reports for the school year ending March 4, 1895, give the following figures: There were 64,567 male and 62,398 female persons between the ages of four and twenty years resident in the State; resident pupils enrolled, 85,356; average daily attendance, 66,046; teachers employed, 3,274; schoolhouses built during year, 73; schoolhouses in the State, 1,844; value of schoolhouses and grounds, \$2,453,992; of furniture and apparatus, \$336,559. The average per cent. of the taxes voted and levied for school purposes was 5-31 mills.

The State Normal School, at Drain, sent out one of its largest classes in June, consisting of 1 post-graduate, 4 commercial, and 35 normal students.

The Agricultural College, at Cornwallis, graduated in June its largest class, numbering 51, of whom 26 were girls. At the beginning of the new school year, in September, 255 students were enrolled.

The medical department of Willamette University has been moved from Portland to Salem. The medical faculty all resigned the same evening that the trustees decided upon the removal, but before the decision was learned.

State Institutions.—The appropriation to the Soldiers' Home by the Legislature of 1893 was \$24,000, and for deficiency \$10,981. The home was opened May 24, 1894, with 7 inmates. A joint committee of the Legislature was appointed to investigate the affairs of the institution, and reported finding bad business management, extravagance, and dishonesty on the part of the managers.

An appropriation of \$29,800 was made for the deaf-mute school, and one of \$20,200 for the blind school. The deaf-mute school also received for deficiency \$7,500, and the blind school \$1,129.

For new buildings at the Reform School \$2,176 was appropriated; for general expenses, \$26,000; for improvements and salaries, \$20,500; for waterworks and lighting, \$10,700.

The appropriation for the Penitentiary was \$121,250. The number of convicts in March was 359, of whom 2 were women; in October the number was 326. The monthly *per capita* expense was about \$11. There is work enough only to keep the convicts busy about half the time. The stove foundry is run three days of each week, employing 145 men. There are 32 trustees, who are allowed to work on the farm.

In July the number of patients in the Insane Asylum at Salem was reported as 1286; the number of officers and employees was 117. The expense *per capita* was given as \$9.87 for June, but after the asylum management changed hands, Aug. 1, it was found that the *per capita* expense had been really greater. About 1,200 acres are under the management of the asylum.

The Legislature of 1890 appropriated \$165,000 to buy land and build a branch asylum in the eastern part of the State. A permanent injunction was sought to restrain the Board of Building Commissioners—consisting of the Governor, the Secretary of State, and the Treasurer—from proceeding, on the ground that the Constitution declares that all State institutions shall be at the capital. A permanent injunction was granted, an appeal was taken, and the Supreme Court reversed the decision, remanding the case to the lower court with leave to amend. The next decision made the injunction perpetual, and on appeal again to the Supreme Court the injunction was dissolved and the complaint dismissed, on the ground that the Governor could not be enjoined while in the discharge of his official duties. The constitutional question was left undecided.

Industries and Products.—The report of the Game and Fish Protector shows the number of cases of salmon packed in bins on the Oregon side of Columbia river to have been 439,138, and the value \$3,282,408.63. The value of apparatus used was \$284,233, the number of factories 25, and their value \$678,569, while of allied factories, such as can and box and fertilizer plants, there were 5, of the value of \$181,000. The number of men employed in the fisheries, factories, etc., was 5,348, and the wages, \$1,236,221.

The product of gold in 1894 was \$1,696,368, and that of silver \$12,257.

Oregon is to have the only pine-noodle factory in America. It will be at Grant's Pass. The foliage of the *Norman* pine, which abounds in the vicinity, will be converted into soap, caustics, and oils.

Railroads.—The report for the year ending June 30, 1895, shows an increase of shipments of fruits, live stock, and hay over those of 1894 of nearly 10,000 tons by the Southern Pacific. Its gross earnings were \$1,599,526, and operating expenses \$1,217,080.

The statistics of the Oregon Railway and Navigation Company show an increase in the

transportation of grain and its products for 1895 of 200,000 tons over 1894. The proportion of expenses to earnings in 1894 was 84 per cent., while in 1895 it was 75½ per cent. The gross earnings were \$2,819,406.

The expense of maintaining the Northern Pacific in Oregon was not met by its earnings, which came short nearly \$75,000.

The Washington and Columbia showed a percentage of expenses to earnings of only 39 per cent. The business of the company is almost entirely transportation of grain and live stock. Its gross earnings were \$61,588, and its operating expenses \$24,043.

On all the roads there is a decided falling off shown in the passenger traffic.

Industrial Exposition.—The Oregon Industrial Exposition opened at Portland, Oct. 5, and closed Nov. 5. It was a fine exhibit of the products and resources of the State, and was thronged by visitors. A guarantee fund was subscribed, as it was not expected that the low price of admission would yield income enough to defray expenses; but the secretary's report shows that this fund was not drawn upon. Single admission tickets were sold at 25 cents, and children were admitted for 5 and 10 cents. The receipts were \$20,460.23. The estimated total attendance was 97,355. The balance remaining was \$2,226.66.

Public Lands.—The total sales of lands through the office of the clerk of the Oregon State Board of School Land Commissioners during 1895 amounted to 71,923.96 acres, and the amount paid was \$92,956.93.

The Siletz Indian reservation was opened to settlement July 25. It has an average width approximately of 12 miles, and runs up and down the coast about 24 miles.

Assessment of Deposits.—A law passed in 1870, providing for the assessment of bank deposits, which has been largely inoperative because banks have refused to obey its provisions, was brought up in a case of indictment of a bank officer for refusing to furnish an assessor with a list of depositors. The law was declared unconstitutional, for the reasons, among others, that it "attempts to require of a particular class of citizens the performance of a special duty not required of any other citizen—i. e., that of assisting the assessor of this county to discover a certain class of personal property of the taxpayers of this county to enable the assessor to assess the same," and that it is in direct conflict with the act of Congress establishing the national banking system.

Legislative Session.—The eighteenth biennial session of the Legislature began Jan. 14, and ended Feb. 23. On joint ballot the Republicans had 72 votes, the Populists 10, and the Democrats 8. Joseph Simon was elected President of the Senate, and C. B. Moores Speaker of the House.

A United States Senator was to be elected. At a caucus of the Republican members, held Jan. 16, Mr. Dolph, the present Senator, was made the party candidate. But the minority afterward refused to be bound by the action of the caucus, and put forward Judge F. A. Moore as their candidate. W. D. Hare was nominated by the Populists, and A. S. Bennett by the

Democrats. Mr. Dolph did not receive the number of votes necessary to his election, and a deadlock ensued, which lasted almost till the close of the session. George W. McBride was then named as a candidate upon whom the Republicans might unite, and he was elected, Feb. 23, on the sixtieth ballot.

The ballot law was amended so as to provide that a candidate's name may appear in only one place on the ballot.

County courts are authorized to form irrigation districts upon the vote of electors in the territory proposed to be included.

County courts are also empowered to form diking districts, similar to road districts. Clatsop is the only county liable to need this provision.

A State Board of Medical Examiners for granting licenses to practice was created. It is to be appointed by the Governor, and to consist of one homœopathic, one eclectic, and three allopathic physicians. A pharmacy board also was created.

A law was made extending to one year the time within which a judgment debtor may redeem property after it has been sold under execution, and the sale confirmed. The question came before the courts during the year, whether this change would apply to mortgages given while the old law was in operation, the claim being made that this would be contrary to the United States Constitution, which ordains that no State shall pass any law impairing the obligation of contracts. The court held that the law was valid, the purchaser being no party to the contract made by the mortgage; if he happens to be the same person as the mortgagor, that is merely accidental, his relation as mortgagor ceasing when he assumes that of purchaser; and that the sale is the remedy or mode provided by law for the enforcement of the contract, and not a part of the contract.

The only bill for revenue passed at the session was one for taxing insurance companies, which, it was estimated, would bring \$40,000 a year to the State.

An act was passed providing for the assignment and satisfaction of mortgages, one prescribing the method of discharging attachments, and one providing that attachments may be sworn out where mortgages or other pledges have been given, but have been rendered nugatory by act of defendant.

An appropriation of \$9,000 was made to the Board of Horticulture for use in exterminating fruit pests.

The law for the protection of fish and game was changed in some respects. It is a sportsman's measure only, and makes no mention of the salmon industry.

Among other acts of the session were the following:

Authorizing the Domestic Animal Commission to apply the "tuberculin" test to cattle in supposed cases of tuberculosis.

Requiring building and loan associations to deposit securities with the Secretary of State or trust companies and to make statements of their affairs to the Secretary of State.

Limiting liabilities of stockholders in corporations to amount of their unpaid stock.

Punishing for killing song birds or molesting their eggs or nests by \$5 to \$100 fine.

Amending the act creating the State Board of Horticulture and appropriating \$9,000 for the ensuing two years.

Cracking kettles on horses for shoeing.

Prohibiting miners from going into places of evil report and fining corporations \$100 for sending them there.

Authorizing the Governor to lease by contract water labor at not less than 35 cents a day.

Fixing the age of consent at sixteen years.

Four constitutional amendments were voted, to be submitted to the people at the next election, among them one abrogating that provision which guarantees foreigners in the State equal property rights with citizens, one adding an article prescribing the means of preserving right of way for water pipes, reservoirs, etc., and one enabling the Legislature to increase the number of justices of the Supreme Court.

P

PARAGUAY, a republic in South America. The legislative power is vested in a Congress consisting of a Senate of 13 members and a Chamber having double that number. The President, for the term of four years ending in 1908, is Gen. Juan B. Eguisquiza.

Finances.—The treasury receipts for 1894 were 4,547,135 pesos, of which 245,208 pesos came from sales and leases of land, 3,813,619 from customs, and 488,308 from other taxes. The expenses were 5,007,936 pesos, of which 1,542,086 pesos were used in general expenses of the Government, 94,772 pesos in payment of debt, and 3,371,068 pesos for extraordinary purposes. In respect to its bonds held in Europe, on which no interest has been paid since 1891, the Government agreed in August, 1895, to an arrangement whereby it will pay 1 per cent. for the first three years and $\frac{1}{4}$ of 1 per cent. more every succeeding three years till 3 per cent. is reached, and will begin redemption in 1900.

Colonization.—At the end of 1893 there was one German colony numbering 941 persons and another having 273, an Italian colony of 230, the Colonia Nacional having 1,015, another settlement with 814, and the socialistic Australian community, called Nueva Australia, which then numbered 420 persons. The Government consoled the Australians, who had left their own country in disgust after the panic of 1893, a rich tract of 900 square miles on the Tibiquari river, on the condition that 1,200 immigrant families should be settled there within six years. Colonists presented themselves in numbers, each subscribing \$300. In this way \$150,000 was raised to start the colony. Those who first arrived, in September, 1893, were disappointed at their wild surroundings. All were to receive equal pay, and there was to be no authority. A division arose over the question whether indentureds should be allowed, and when the chief manager and the total-abstainers insisted on having their way 85 persons left the colony. They were on the point of returning to Australia when the Paraguayan Government granted to them another tract, in the department of Gonzalez, where they have since prospered. Another schism occurred in the original colony, as consequence of which the director and about 50 of the sturdiest colonists went to settle in another territory. The bickerings continued, and in September, 1894, a band of 25 left and went to Buenos Ayres. Those who were left then reorganized the community, dropping most of the communistic features and choosing for leaders their most intelligent men.

Commerce and Communications.—The value of imports in 1894 was 2,222,000 pesos in

gold; that of exports, 1,825,000 pesos. During the year 230 steamers and 56 sailing vessels, of an aggregate burden of 104,324 tons, were entered from foreign ports at Asuncion. Nearly half the imports come from England. The principal articles of import are textile goods, wine, and rice. The chief exports are yerba mate, hides, tobacco, and timber. There are 136 miles of railroad. A telegraph line bringing Asuncion into communication with other countries was completed in March, 1894.

PASTEUR, LOUIS, a French chemist, born in Dôle (Jura), Dec. 27, 1822; died in Paris, Sept. 28, 1895. He was the son of a tanner who had been a soldier and who had been decorated for valor. When he was an infant his parents

LOUIS PASTEUR.

removed to Arbois, where he entered the communal school and then showed a greater fondness for sketching than for studying. Subsequently he went to the college in Besancon and was graduated as Bachelor of Letters. He became a tutor there and prepared for the Ecole

Normale in Paris. At the examination he attained the rank of fourteen and was admitted, but this did not satisfy him, so he settled in Paris and studied in the Institution Barbet, and in 1843 was admitted to the École Normale, standing fourth in the class. Here he studied chemistry under Balard and Dumas and crystallography under Delafosse, and after completing his course was successively assistant in physical sciences and demonstrator in chemistry, receiving the degree of Doctor of Sciences in 1847. While in the École Normale he showed the cause of the difference in the behavior of the ammonium-sodium racemate and the corresponding salt of tartaric acid with polarized light to be lack of symmetry in the crystals. At this time also he pointed out the difference between the dextrorotatory and the levorotatory tartaric acid, and proved that the two acids could be separated one from the other by a process of fermentation started by a special form of mold. This investigation, establishing the relations between crystalline form and optical properties, and throwing considerable light on the architecture of molecules, was really the foundation of stereochemistry, and was made with funds supplied from his own slender resources; his success in this particular branch of inquiry was considered remarkable for so young a man. In 1848 he was called to the chair of Physics in Dijon, and in the same year he accepted a similar appointment in Strasbourg.

In 1854 he was charged, in the capacity of dean, with the task of organizing the faculty of sciences in Lille, and he remained there until 1857, when he was called to Paris to take charge of the scientific studies of the École Normale. He continued in the active administration of this work for ten years, and in 1862 became also Professor of Geology, Physics, and Chemistry at the École des Beaux Arts. Meanwhile in 1857 he began his famous researches on fermentation. He distinctly proved that the changes occurring in each of the various processes of fermentation were due to the presence and growth of a minute organism called the ferment. His own words are: "The chemical act of fermentation is essentially a correlative phenomenon of a vital act beginning and ending with it. I think that there is never any alcoholic fermentation without there being at the same time organization, development, multiplication of globules or the continued consecutive life of globules already formed." Thus the science of bacteriology, of which he has been called the father, came into existence. He also showed that this change was not so simple as was represented in the mere splitting up of sugar into alcohol and carbonic acid, but that other important substances were produced, as, for example, succinic acid and glycerin. The practical application of his studies came later when he showed that the ferment of wine exists on the surface of the grape when it has ripened, and when he indicated that, in the case of wine as well as in beer each special form of deterioration was due to a special organism. The property of turning sour or becoming bitter, characteristic of wines of low alcoholic strength when kept for a time, was found by him to be due to a similar cause. Such

diseases were remedied on his suggestion by a process called "Pasteurization," which consists in heating the wine slowly, when bottled off, to a temperature of 65° C., and then allowing it to cool. A similar process was applied to beers. By pointing out that the deterioration of certain wines and beers was due to a specific ferment, and by showing how the action of this ferment could be prevented, he accomplished a saving of enormous sums to two very important industries. And this was done by careful experiment and by bringing to bear on the subject an intelligence trained in exact methods and in unerring observation, coupled with employment of the microscope and the other aids of modern research.

In 1865, on the suggestion of Dumas, the chemist, he undertook the study of the silkworm disease, which at that time threatened to destroy the entire silk industry of central France. The value of raw silk in 1853 was placed at 130,000,000 francs, and in 1865 it had fallen to one fifth that sum. Vittaliani and Cornalia had shown in 1859 that the mobile corpuscles, which previous observers had detected in the worm and in the eggs, were closely connected with the disease. Pasteur, when he began the inquiry, had never even seen a silkworm, and knew nothing of its habits and life history. He spent several years in tracing the germs of the "pebrine" disease through the various stages of development of the egg, larva, chrysalis, and moth, and soon found that the parasite, once introduced, persisted through all the stages of the animal's life, and that even the eggs were infected. He came to the conclusion that the only method offering any hope of success was a radical extermination of all infected moths and eggs, and recommended the following plan of treatment: When the female has laid her eggs and dies, the body is dried, pounded up in water, and examined microscopically; if no corpuscles are found, the eggs are preserved for culture; but if any corpuscles are discovered, all the eggs of that moth are immediately burned. Each moth is examined in the same way, and all infected hatchlings are destroyed. In 3 departments alone subsequent to the application of this treatment the annual value of silk rose from 1,500,000 to 22,000,000 francs.

In 1867 he was given the chair of Chemistry in the Sorbonne, which he held until 1875. Toward the close of this period a controversy arose as to the truth of the theory of spontaneous generation. Pasteur, by a series of the most delicate and convincing experiments, proved the existence of micro-organic forms and their spores in the air, and showed that while unpurified air was capable of setting up fermentative changes of various kinds, the same air freed from germs could not give rise to these changes. The advocates of spontaneous generation were silenced. Later he began the study of inoculation as a cure for diseases other than smallpox. He demonstrated that animals of the ovine and bovine species may be prevented from contracting the disease of anthrax (charbon) or splenic fever, as it is variously called, by inoculating them with attenuated germs of the specific minute organism which is found to exist in that disease and to be its efficient cause. The mortality, which

before the introduction of the preventive treatment was in the case of sheep 10 per cent., was after the adoption of inoculation reduced to 1 per cent. In the case of chicken cholera he demonstrated its cause to be a micrococcus which, when it was cultivated in the manner prescribed by him and the fowl was vaccinated with the attenuated virus, rendered the latter proof against the cholera, even when placed among other infected fowls.

Pasteur's last and crowning triumph was in the application of his method of inoculation to rabies. He began the study of this subject in 1880, but could isolate no specific germ. He, however, found that the disease had an especial affinity for and was concentrated in the nervous centers; hence he employed emulsions of nerve substance in his inoculations, as he otherwise would have used culture fluids. Rabbits, in which the disease always assumes a paralytic and painless character, were inoculated, and the germs of these animals, after appropriate treatment, were used for the inoculation of others; and this process was repeated until a sufficiently attenuated virus was obtained. He soon found that dogs which had been inoculated were perfectly protected and that they might be bitten by mad dogs or inoculated with the most powerful rabid virus without infection. In treating a case of suspected infection from a rabid animal a series of inoculations was made, beginning with the weakest fluid and ending with a virus that, if used at first, would have inevitably proved fatal. Its application to humanity was tried, and the story has been told in bronze. The French nation erected, with funds raised by popular subscription, the Pasteur Institute, which is devoted to carrying out in practice the

of a French shepherd boy engaged in a death struggle with a mad dog which had been worrying his sheep. The boy who was the original of the statue killed the dog with his bare hands,

but was horribly bitten in the combat. He underwent the antirabic treatment, which proved successful, for he remained perfectly healthy, and his deed and its consequences are now historic. Institutions for the antirabic treatment have since been established in the largest cities of the world. Pasteur's last experiments of this character were made in 1892, when he inoculated animals for cholera, but its successful application to humanity has not yet been accomplished.

In 1874 he was awarded 12,000 francs by the Society of Encouragement of Paris and an annuity of the same value by the National Assembly of France, and in 1875 was also given a full retiring pension from his professorship at the Sorbonne. Oxford gave him in 1882 the degree of Doctor of Sciences. In 1882 he was elected to the Academy of Sciences in the department of mineralogy, and in 1887 was chosen to succeed Vulpian as perpetual secretary of that body, but this office he resigned two years later, and he was then made honorary perpetual secretary. He was elected to the French Academy in 1881, taking the seat of Littré. In 1889 he was chosen a foreign member of the Royal Society of London, from which organization he received its Huntford medal in 1896 and its Copley medal in 1874. Napoleon III signed a decree in 1870 making him a senator, but, owing to the war, the decree was never issued. He was made chevalier of the Legion of Honor in 1864 and, after passing through the various grades, received the Grand Cross in 1881. Foreign orders of every description were sent to him and prizes of large sums of money were given to him. His name was enrolled in the great scientific societies of the world, including the National Academy of Sciences in the United States. A medal

antirabic treatment, with laboratories and every convenience for extending by research the knowledge of the preventive treatment of infectious disease. In front of this building is the statue

was given him by his associates, friends, and admirers in 1882; and he was presented with a gold medal on the anniversary of his seventieth birthday, in 1882. The presentation took place in the Sorbonne and was presided over by President Carnot. Addresses in his honor were made by representatives of scientific bodies from all over the world, who had been sent to render homage to the great *savant*. Besides his minor contributions he published: "Nouvel exemple de fermentation déterminée par des animaleules infusores pouvant vivre sous oxygène libre" (1863); "Études sur le vin, ses maladies, les causes qui provoquent" (1866; second edition, 1872); "Études sur le vinaigre, ses maladies, moyens de les prévenir" (1868); "Études sur la maladie des vers à soie" (1870); "Études sur la bière, ses maladies, les causes qui les provoquent" (1876); "Les Microbes" (1878); and "Examen critique d'un écrit posthume de Claude Bernard sur la fermentation" (1879). The story of his life was written by his son-in-law, M. Valléry-Radot, under the title "M. Pasteur, histoire d'un savant par un ignorant." At the time of his studies on the silkworm he was warned to discontinue his work, but he declined. A discovery was given to the world, but at the expense of half of his body, for he was paralyzed. He recovered, but overworked at the time of his investigations on rabies, and in 1886 he was again prostrated, from the effects of which he never completely rallied, though his death was comparatively sudden. A national funeral was decreed for him by President Faure. His body lay in state in the Pasteur Institute, and the funeral ceremony took place in the Cathedral of Notre Dame. The Government desired that his remains be interred in the Panthéon, but his own wishes were respected, and he was buried in the garden of the Pasteur Institute.

PATENTS AND INVENTIONS. In this article the intention is to describe a few of the most recent inventions that may be considered of general interest or specially suited to home application.

Steam Lifeboats.—Among the improvements recently introduced in the English Lifeboat Service are boats propelled by steam. There are 3 in the service now, the 2 earlier boats having proved their usefulness during two or three years, and the third, the "City of Glasgow," being the improved result of the former experiments. She was planned by G. W. Watson, the yacht designer, and cost £3,500. The machinery was constructed by Penn & Sons, of Greenwich, the engines being designed after Green's patents for what is known as "jet propulsion." They are of 225 horse power, and drive 2 nearly horizontal turbine wheels of 30 inches diameter. The total weight of the machinery is 10 tons. The boat is 53 feet long, 16 feet beam, 5½ feet deep, and of 30 tons displacement. She is constructed mainly of galvanized steel, with heavy bilge keels and fender gunwales of American elm. Ample water-tight compartments are provided fore and aft, the boiler and machinery being in separate compartments. The jets are so arranged that the boat can be driven backward, forward, or sidewise, or given a rotary motion. On her trial trips the

"City of Glasgow" made a most satisfactory record in all kinds of weather, and she is now stationed at Harwich, one of the most exposed points on the English coast.

This craft has been presented to the Lifeboat Service by the people of Glasgow, who raised the required funds in small subscription, and are still contributing largely to the institution through the establishment of what is known as "Lifeboat Saturday," a certain day on which subscriptions are solicited for this purpose.

A Novel Craft.—The Layman pneumatic sporting boat is an invention that commends itself at first sight to the hunter and the fisherman. The accompanying illustrations suffi-

SPORTING BOAT.

ciently show its external appearance. In effect it is an elliptical float made of India rubber or other flexible waterproof material, tublike, and with a pair of boots permanently attached to its bottom or under side. These boots are provided with fins or paddles at the sides and under the soles, which fold when moved forward and open on the return stroke. The navigator, seated in his boat, with his feet in the boots, moves his legs backward and forward as in walking, and

SPORTING BOAT, WITH STORM CAPE.

propels the boat or turns at will in any direction. The sides of the float are double, and are divided into water-tight compartments, any one of which is capable of sustaining one person if

the water. To upset is well-nigh out of the question, except by design; and if by accident the boat should be filled with water, it will still float with the load for which it is designed, and can still be propelled as described above. It is possible, though not very easy, for the wearer of the Layman boat to walk on land or wade in shoal water. When afloat, a fair rate of progress can be made in still water, not to exceed 3 miles an hour, but this is effected in absolute silence and without the conspicuous movement of paddles or oars so alarming to game of all kinds. A storm cape is provided, which buttons down round the rim of the float and effectually protects the wearer against rain or spray. The float is also provided with sockets in which screens or awnings can be placed for further concealment or protection.

Electric Propeller.—A portable electric propeller, capable of being applied to any boat, has been introduced recently by the Portable Electric Boat Propeller Company, of New York. Its general appearance is shown in the illustration. Briefly described, the propelling device

A PORTABLE ELECTRIC PROPELLER.

consists of a curved tube carrying a screw propeller at the submerged end, and having within it a freely revolving flexible shaft connecting with the propeller. An electric motor is mounted upon the tube near the point where it rests upon the stern of the boat. A handle or tiller in continuation of the tube, projecting still farther forward, is within reach of the steersman. The motor is actuated by batteries carried in the boat amidships. The flexible shaft is made of phosphor-bronze. Near the propeller, and on the under side of the tube, is a metallic fin which serves as a rudder. The whole apparatus is pivoted in a socket affixed to the stern of the boat. The propeller, motor, and rudder together weigh about 35 pounds, and the batteries weigh from 100 pounds to nearly 300, according to the amount of power to be developed. The machinery is set in motion and disengaged by a very simple and easily operated adjustment, and the propeller can be driven (out of water) to 1,500 revolutions a minute. A boat 10 to 18 feet long can be propelled by this apparatus 3 to 5 miles an hour under favorable conditions. The outlay for ordinary purposes is about 5 cents an hour. When not in use for the propelling machinery the batteries are available for any other purpose to which electricity in this form can be applied.

Voting Machines.—The new Constitution of New York provides for the use of voting machines. The provision is mainly with a view to the future, but all who favor simple and direct forms of voting must look upon the introduction of such machines with favor. The presumed object is to enable the voter, whether ignorant or intelligent, to vote for whomsoever he pleases without the possibility of intimidation or compulsion by political managers. Altogether about 25 patents have been issued covering machines of this character. One that has attracted much attention is known as the Myers machine. It is contained in an iron cupboard, not unlike the ordinary voting booth in appearance, with one door through which the voter must make his entrance and exit. Within, fastened to one side of the booth, is a series of electric buttons, each of which belongs to the name of a candidate. The names are further distinguished by being printed on paper of different colors, indicating the different political parties. Thus, in case of doubt, the voter may to a certain extent fall back upon his color sense in order to be sure of his political affinity. The act of opening the door of the booth releases all the locks connected with the different registering machinery; the act of touching any one button registers a

vote for the particular candidate to whom some the button is attached, and at the same time shuts off the names of all other candidates for the same office. Thus, while the voter may vote as he likes for a Democratic governor, a Republican mayor, or a Prohibition abolitionist, he can not

by any blunder vote for both a Democratic and a Republican governor. With a machine of this kind, the entire independence of the voter presents an insuperable bar to almost all kinds of bribery. The cost of one of these machines, compared with the cost of printing, paper, etc., incident to an ordinary election by ballot after any of the systems at present in vogue, seems to be in favor of the machine. But that can only be decided by the test of actual experiment. Under the State law, the town of Mount Vernon, N. Y., tried the Myers machine at the last election, and the result is said to have been highly satisfactory, the complete return having been ascertained within a few minutes after the polls were closed.

Window Screens.—Probably almost every one has noticed that when a restless domestic fly alights upon a pane of glass or upon an ordinary wire screen, he immediately begins to crawl upward. It has taken all these years for the human race to discover that a properly placed opening will allow the fly to escape into the outer air. Apparently it is only necessary to remove the top moulding of an ordinary wire window screen, leaving a space between the mesh

and the wire gauze. Of course a neater and more workmanlike arrangement will occur to any one with mechanical ingenuity, but the principle is merely to have an opening extending the entire width of the window at the upper part of the screen. It is evident that it is possible for flies to enter the room through this opening, which is only intended for exit, but the few that will find their way inward bear a very small proportion to the larger number that inadvertently second the inventor's intention. G. P. Yule, the inventor, attaches no conditions or patents to his device, and it is safe to conclude that its use is open to all.

Rapid transit is one of the vital questions of the day, not only in the large cities but for long distances as well. The necessary conditions of electric motors and high rates of speed seem to indicate that for 2 through lines an almost straight course must be laid. With speed such as is contemplated, any curves must be very objectionable, owing to the almost irresistible lateral pressure. Experiments in the direction of single-rail roads have been in progress during the past year. A road of this description has been constructed across Long Island, and an experimental section has been in successful operation for some months.

Another device in this same direction is the Chase-Kirchner Aërodrôme Railroad. As on the other road, the ends of the cars are sharp like the bows of a ship, so as to offer the least resistance to the air. In this road, however, a novel feature is introduced in a set of aëroplanes, readily adjustable, and intended to aid in overcoming the grades that may be encountered along the line. Elaborate experiments by Maxim, Langley, and others have proved that the most effective aëroplanes are short in the direction of motion—that is to say, like a bird's wing moving edgewise. A set of Venetian window blinds gives a good idea of the arrangement of these aëroplanes; they are supported on strong framework above the cars, and can be delicately adjusted to any angle. On both these roads a very high rate of speed is anticipated, 150 miles an hour being claimed as possible, while 100 miles an hour is confidently hoped for. To attain such speed with safety, curves must be abolished; and since there must be no such obstructions as are inseparable from grade crossings and the like, the track must be elevated. The single-rail system of course greatly simplifies the engineering problem, does away with the necessity of snow sheds and the like, and reduces the expense of right of way to a minimum. On a level the aëroplanes will be kept practically straight, and an ingenious mechanical device is arranged so that the lifting effect will increase or decrease automatically according to the steepness of the grade.

That the electric trolley must give way to exclusive and storage batteries is generally admitted by electrical engineers. Conduit systems are in successful operation in Washington, and an underground electric system has been successfully tested in the Buda-Pesth street railways, which run in all directions through that city. These, according to the "Railway World," have been in operation several years, and their success from an engineering as well as

from a financial point of view is assured. This is believed to be at present the only tramway in Europe that is successfully operated by means of an underground conduit. The safety of the system as regards possibly fatal shocks from broken wires and the like is said to be fully demonstrated in practice.

An interesting experiment is reported from the American Car Company of St. Louis, which constructed a car especially for the purpose, space for the batteries being provided under the seats, accessible through openings at the rear of the car. The system followed was that of W. L. Silvey, of Dayton, Ohio, and the aim of the constructor was to secure the highest efficiency and the least possible weight consistent with an apparatus capable of withstanding the almost unlimited amount of hard usage that is unavoidable under such circumstances. It employs 108 cells, each weighing 27 pounds, and the total weight of the batteries is about 3,000 pounds. In a test run a round trip of 9 miles was made in thirty-five minutes. This included several complete stops, two considerable grades, several railroad crossings, and a long bridge. It was evident that 20 or 25 miles an hour was easily within the capacity of this car. It made 6,300 car miles, and no repairs were necessary either for the batteries or for the motor, the only renewals required having been a new set of carbon brushes. The total expenses for repairs was \$2.50, all of which was expended upon the trucks. It is believed that a car can easily be operated at a cost not exceeding 8 cents a mile.

With the advent of storage batteries for car service, the danger from rioters will be largely diminished. Under the trolley system, a single broken wire may disable an entire line of cars, while if each car is provided with an independent storage battery a separate attack will be necessary for each car in order to effect a wholesale stoppage.

Electric Traction.—The end of the year saw 9,000 miles of electric railway of different types in operation in the United States and Canada. The rolling stock included 30,000 cars, with 850,000 horse power, and the population per mile of track was 8,200. In contrast with this, in all Europe there were at last accounts only 500 miles in operation, with 1,260 cars and 24,700 horse power, and this with a population per mile of track of 765,000. Germany leads off with 190 miles; Great Britain follows with 65, France with 60, Austria-Hungary with 50, and Italy with 15. The rest of the 460 miles is made up of small lines scattered through the various nations. The English quota lies mainly in 2 lines, in London and Liverpool.

New Building Material.—Specimens of glass building blocks, or glass bricks, as they are popularly called, have been introduced in France and Germany, it is reported, with satisfactory results. They are hollow blown, very light, and strong enough to serve many architectural purposes. For domes, it is believed they will be peculiarly adapted, since their lightness will be largely in their favor as contrasted with brick or stone, and they will admit a modified light from sun and sky that will be very pleasing. In like manner they may be used for wall spaces where absolute solidity is not required,

and in many cases they may take the place of windows, where light without ventilation is the principal end in view. Walls constructed with these "bricks" retain heat longer than any other kind, and since they admit sunlight they are peculiarly adapted to the building of green-houses and conservatories. Walls 27 feet high have been built of glass bricks, without a strengthening framework, but above that height some supports are regarded as necessary. No mention is made of the endurance of the glass bricks under heat, as in case of fire, but they will no doubt stand quite as well as many of the substances now in common use. They are known to the profession as "Talconnier's blown-glass bricks," and specimens were shown at the annual exhibition of the Architectural League.

Disposal of Kitchen Refuse.—Among the most difficult of the sanitary problems in connection with housekeeping, particularly in large cities, is the disposal of kitchen refuse. How to remove it and keep it separated from other kinds of waste material is a perpetual puzzle for municipal boards of health. A simple and inexpensive device has been introduced lately by the Sanitary Construction Company, of Boston, and has received the approval of the authorities of that city and New York. Col. George E. Waring, Street Commissioner of New York, has tested it personally, and gives it his approval. It consists of an addition in the

time. In point of fact, the refuse is by this means reduced to charcoal, which can be used in kindling the fire the next morning, or can simply be thrown upon the fire and consumed altogether.

A New Library Index.—The difficulties in the way of indexing a large library to which

additions are being constantly made is one of the greatest with which librarians have to contend. The card catalogue has been heretofore the nearest approach to a solution, but a recent invention, originating in the Newberry Library Chicago, appears to be a great advance even upon the card catalogue. This consists essentially of a box with a glass top, standing about breast high, and furnished with a crank. Inside are 2 hexagonal prisms turning on their axes, to one of which a crank is attached. Around them, and falling almost to the bottom of the box, is an endless chain made up of light metallic frames with flanged edges, into which can be inserted cards containing the designation of the books in the library. Looking in through the glass top, the user sees 4 long pages of cards arranged in alphabetical order, and he can turn

A HOUSEHOLD GARBAGE CARBONIZER.

shape of a horizontal cylinder set into the kitchen stovepipe near the point where it issues from the stove or range. One end of the cylinder is removable, and attached to it is a rack or scoop with perforated sides and a tight bottom, as shown in the illustration. The refuse is placed in this scoop, and the whole is then re-inserted in the cylinder. Enough open space is left around the receptacle and within the cylinder to admit of free draught, and the action of the heat and the products of combustion from the fire soon drives off the water from the refuse and reduces the solids to the form of carbon. All odors and gases resulting from the process go up the chimney, where they can do no harm. The skeptical may doubt the efficiency of this contrivance, on the ground that unless a very hot fire is perpetually kept up there will not be heat enough to effect the purpose; but a low degree of heat kept up for a long time will have the same effect as a greater heat for a short

the crank in either direction to bring into view any other pages that he may want. The frames

of the pages are so linked together that they can be readily unlinked at any point, and additional ones inserted. Short wire projections at the corners of every sixth page slide upon semi-circular guides, and cause the slack of the endless chain, or that portion not in immediate use, to arrange itself in a compact and methodical manner within the box, as shown in the illustration. The contrivance is called the Rudolph continuous indexer.

A Wire Flywheel.—A novel flywheel has been constructed recently at the Mannesmann Tube Company's works in Germany. It consists of a cast-iron hub or boss, to which are attached 2 steel-plate disks or cheeks, about 20 feet in diameter. The peripheral space between the disks is filled in with 70 tons of No. 5 steel wire, completely wound around the hub, the tensile resistance thus obtained being found to be far superior to that of any casting.

This huge flywheel is driven at a speed of 240 revolutions a minute, or a peripheral velocity of 2·8 miles a minute, or approximately 250 feet a second. For such a flywheel the length of wire is estimated at 250 miles.

PEACE SOCIETIES, organizations having for their object the settlement of disputes between nations by arbitration rather than by war. The leading organization of this nature is the International Peace Association. In the United States the general organizations, with many branches, are: The American Peace Society, with headquarters in Boston, and the Universal Peace Union, with headquarters in Philadelphia. The American Peace Society, in 1891, made arrangements for a Peace Conference to be held in Chicago during the Columbian Exposition of 1893. At this conference the following memorial was issued to all the governments of the world, and the Secretary of State sent facsimile copies to them:

The undersigned, citizens of many countries, gathered at the Columbian Exposition in Chicago, in the United States of America, recognizing the advantages accruing to those nations which have pursued the policy of arbitrating international disputes, and desiring that like benefits may in the future be enjoyed by all nations, and deeming this opportunity fitting, do hereby join in this memorial to all our various governments, praying that they will unitedly agree, by mutual treaties, to submit for settlement by arbitration all such international questions and disputes as shall fail of satisfactory solution by ordinary and peaceful negotiations.

The work of the Peace societies received direct aid from the Pan-American Conference in April, 1890, when these resolutions were adopted:

1. That the principle of conquest shall not during the continuance of the treaty be recognized as admissible under American public law.
2. That all cessions of territory made during the continuance of the treaty of arbitration shall be void if made under threats of war or the presence of an armed force.
3. Any nation from which such cessions shall be obtained may demand that the validity of the cessions made shall be submitted to arbitration.
4. Any renunciation of the right of arbitration made under the conditions named in the second section shall be null and void. These conditions are under threats of war or the presence of armed force.

The resolutions were accompanied by a report of the conference, setting forth in detail the

manner in which arbitrators shall be selected and the manner of reaching and declaring their judgments. There is to be no restriction of choice of arbitrators; they may be nations, scientific societies, officials, or private citizens. Unless it is specifically agreed previously that unanimous judgment shall be required, a majority of the arbitrators shall decide the question of issue. Where the arbitrators consist of an even number, each nation may appoint an umpire. Any nation deeming itself interested in or affected by the decision of any question may appoint an arbitrator in the case. It is provided that ratifications of the treaty shall be exchanged at Washington, and it shall be in force for twenty years from the date of its proclamation. After that term has expired the treaty shall remain in force until one year after any nation has given notice to all the other nations party thereto of its desire to withdraw; but the withdrawal of any nation shall not relieve the other nations of their duties under the agreement. The report also recited that "this conference, having recommended arbitration for the settlement of disputes among the republics of America, begs leave to express the wish that controversies between them and the nations of Europe may be settled in the same friendly manner."

Early in 1895 the French Chamber of Deputies voted to ask the Government to negotiate a permanent arbitration treaty with the United States. The House of Commons declared strongly in favor of international arbitration, and in 1893 transmitted the following to the Government of the United States at Washington:

Resolved, That this House has learned with satisfaction that both houses of the United States Congress have by resolution requested the President to invite from time to time, as fit occasions may arise, negotiations with any government with which the United States have or may have diplomatic relations, to the end that any differences or disputes arising between the two governments which can not be adjusted by diplomatic agency may be referred to arbitration and peaceably adjusted by such means; and that this House, cordially sympathizing with the purpose in view, expresses the hope that Her Majesty's Government will lend their ready co-operation to the Government of the United States upon the basis of the foregoing resolution.

At a meeting of the American Peace Society, held in Boston, Dec. 24, 1895, to consider the relations of the United States and England as to the boundary dispute in Venezuela, the following was adopted:

War between the United States and Great Britain is a moral impossibility. Neither nation—surely not our nation—can be guilty of the awful crime of attacking the other. Threats of war by the United States are worse than a stupendous blunder. Christianity, civilization, humanity, condemn not merely war, but threats of war. Justice between nations is good, especially by the powerful to the weak. Magnanimity inspires our country to seek justice for Venezuela from Great Britain. The Monroe Doctrine means, first, the safety of the United States, and, secondarily, the protection of this hemisphere from European oppression. But our safety is assured beyond question by our power. It is folly to so extend the Monroe Doctrine that boundary disputes of ancient origin, growing out of doubtful documents or data beyond our ken, must imperil the peaceful progress of Christian civilization. What madness to embroil our land

in the constant dimensions of the Spanish and Portuguese and mixed races of South America! Our Government has done well to intervene by honorable diplomatic appeal and protest, including urgent request for arbitration. After diplomacy fails two great nations must always arbitrate if the quarrel be grievous. The exact Venezuela boundary sinks into insensibility measured against the peace of the English-speaking people. War between them would shake civilization, inflame malignant passions, inflict immeasurable suffering on the masses of both peoples, the millions of workmen and women, even now struggling hard enough to earn bread for their families. The golden rule condemns war and those wars of war. The rulers of both lands are at fault. Both nations must recede. War between two nations of brothers, leaders of the world and Christian civilization, is impossible. We appeal to the Christian conscience and common sense of our people to do all in their power to maintain inviolate the long existing and steadily growing sentiment of amity and peace between the English-speaking nations.

At the last meeting of the Connecticut branch of the Universal Peace Union arrangements were made to erect the second peace temple in the world, the first having been the Temple of Concord in the Roman Forum. Since 1816 there have been 112 international arbitrations between European nations, the United States, and the states of Central and South America. Nearly 40 have taken place within the last half century, in which period the United States has arbitrated its contentions thirty times, seven times with Great Britain.

PENNSYLVANIA, a Middle State, one of the original thirteen, ratified the Constitution Dec. 12, 1787; area, 45,215 square miles. The population, according to each decennial census, was 434,373 in 1790; 602,365 in 1800; 810,091 in 1810; 1,047,507 in 1820; 1,348,233 in 1830; 1,724,022 in 1840; 2,311,786 in 1850; 2,906,215 in 1860; 3,521,951 in 1870; 4,282,891 in 1880; and 5,238,014 in 1890. Capital, Harrisburg.

Government.—The following were the State officers during the year: Governor, Daniel H. Hastings; Lieutenant-Governor, Walter Lyon; Secretary of the Commonwealth, Frank Reeder; Secretary of Internal Affairs, Isaac B. Brown, succeeded in May by James W. Latta; Treasurer, Samuel M. Jackson; Auditor General, Amos H. Mylin; Attorney-General, H. C. McCormick; Adjutant General, Thomas J. Stewary; Insurance Commissioner, James H. Lambert; Bank Commissioner, B. F. Gilkeson; Secretary of Agriculture, Thomas J. Edge; Dairy and Food Commissioner, Levi S. Wells; Superintendent of Public Instruction, N. C. Schaeffer; Superintendent of Buildings, John C. Delaney; Chief Justice of the Supreme Court, James P. Sterrett; Associate Justices, Henry Green, Henry W. Williams, James T. Mitchell, J. B. McCollum, John Dean, D. Newton Fell. The State officers are Republicans, as are all the justices except McCollum, who is a Democrat.

Finances.—The Treasurer's report for the year shows the receipts to have been \$11,746,411.10, and the payments \$13,402,962.90. There was transferred to the sinking fund \$369,371.50. Some of the largest items among the receipts were as follow: Tax on corporation stock and limited partnerships, \$3,537,840.65; on gross receipts of corporations, \$598,548.62; on bank

stock, \$314,074.27; on incomes, \$31,100.84; foreign insurance companies, tax on premiums, \$513,616.19; on municipal loans, \$136,640.89; on corporation loans, \$322,261.78; on personal property, \$2,207,036.82; on writs, wills, deeds, etc., \$155,231.02; on collateral inheritance, \$1,091,963.05; mercantile licenses, \$232,254; wholesale liquor licenses, \$47,064.21; tavern licenses, \$113,366.16; distillers' licenses, \$7,434.50; bottlers' licenses, \$124,045.76.

Taxes and Valuations.—The amount of taxes collected for the support of the poor was \$1,302,755.93. There was appropriated from the county treasuries for the support of the poor in counties having almshouses \$742,664.00, which makes a total of \$2,339,419.93. The amount collected during the year for the construction and repair of streets, roads, and bridges was \$9,019,185.77.

In the 66 counties making report the common schools have made necessary the levy and collection of \$11,930,907.31. This does not include the amount received by the school districts direct from the State Treasurer.

The total indebtedness of counties is \$32,801,583.91. Philadelphia's debt is \$25,010,339.98, and that of Allegheny County \$2,639,002.72. Nineteen counties have no debt; 16 increased their debt during the year.

In 1804 the value of all real estate in Pennsylvania was \$2,634,001,500. In 1895 it was \$2,741,928,849.

Education.—The report of the Superintendent of Public Instruction for the year ending June 3, 1895, gives the following figures: Number of schools, 25,248; number of male teachers, 8,628; number of female teachers, 17,669; average salary of male teachers per month, \$44.57; average salary of female teachers per month, \$38.34; average length of school term, in months, 7.91; number of pupils, 1,070,417; teachers' wages, \$9,304,329.59; cost of text-books, \$224,205.60; total expenditures, \$12,807,651.12; State appropriation for the school year ending June, 1894, \$5,444,316.23. There were 807 more schools than in the preceding year and 20,003 more pupils, and the increase in teachers' wages amounted to \$305,985.94.

The Cornplanter Indian School, on the reservation in Warren County, is attended by 18 Indian and 6 white children and costs \$200 annually. A class of 20 was graduated at the Carlisle Indian Training School.

The State aid distributed to students of the 13 normal schools amounted to \$11,000 for graduates, and \$65,817 for under graduates. There were 7,125 students in the normal schools, and 1,480 graduated who intend to be teachers.

The colleges reporting the largest number of students were: University of Pennsylvania, 2,102 in attendance and 430 graduates; Girard College, 1,318; Lehigh University, 320 students, 114 graduates; Western University of Pennsylvania, 423 students, 76 graduates; Dickinson College, 328 students, 24 graduates; Lafayette College, 311 students, 48 graduates.

By a decision given in April in a school case at Waverley the reading of the Bible in the public schools of Pennsylvania was practically declared illegal. In his opinion the judge said that denominational religious exercises and instruction in sectarian doctrines in our system of

common-school education are expressly prohibited by the Constitution.

The religious-garb bill has had the effect of excluding the sisters from the ranks of public-school teachers; in some instances the children whom they formerly taught have also been withdrawn from the schools.

The State Superintendent reports that the free-text-book law has given great satisfaction. A noticeable effect is seen in the increased attendance, amounting, in some instances, to 30 per cent.

Banks.—The report of the Bank Commissioner shows the condition of 187 institutions, exclusive of building and loan associations—the report of which was to come later—for 1895. The deposits aggregated \$41,915,517.71; savings institutions, \$73,937,638.28; trust companies, \$103,114,827.73; total, \$218,967,983.72; increase in 1895 over 1894, \$14,043,926.12. The banks reporting to the department had a reserve fund in 1895 of \$8,442,334.48; savings institutions, \$6,375,362.77; trust companies, \$20,450,665.49; total, \$35,268,412.74. The report shows that there was a decrease of \$2,713,596.68 in the reserve fund of these institutions in 1895.

The number of deposit accounts in banks in 1895 was 109,233; savings institutions, 282,677; trust companies, 112,648; total, 504,558. The average to each depositor in all institutions was \$433.98.

Railroads.—The report of the Secretary of Internal Affairs for the year ending June 30 shows that the total amount of stock of railroads operating in Pennsylvania is \$1,099,303,383.42, and the capital stock outstanding \$944,670,893.64. In 1894 the bonded indebtedness was \$982,551,341.93, an increase in five years of \$101,961,832.21.

There was expended \$16,359,034.76 in the equipment, improvement of roads, and construction. The total cost of roads and equipment, as reported to the department, is \$1,538,501,235.29.

There were 1,538 persons killed and 10,607 injured by the steam railroads operating in the State. Twenty-nine of those killed were passengers.

The United States Supreme Court affirmed, in May, the constitutionality and validity of the Pennsylvania statute of 1879 assessing the tax of eight tenths of 1 per cent, upon the gross receipts of railroad companies for tolls and transportation.

The Amalgamated Association of Railway Employees decided, Dec. 16, to declare a strike upon the lines of the Union Traction Company in Philadelphia; their demands were for a working day of ten hours, \$2 a day, and the recognition of the Amalgamated Association of Street Railway Employees. The strike lasted seven days. There were rioting and bloodshed and destruction of property, but no lives were lost. The strike was settled, Dec. 23, by the strikers accepting the company's terms. The new men who had taken the places of the strikers were, by the terms of the agreement, to divide their runs with the old employees who were to be taken back. It was estimated that the strike cost the company in fares \$250,000. The Christmas shopping trade was almost entirely stopped. Three rioters were sentenced to

two years' and one to eighteen months' imprisonment.

The Supreme Court decided in March in a case involving the rights of trolley companies that the street-railway act gives no right of eminent domain, and that, as the trolley lines are incorporated under that act, they have no power to construct their road, where the taking of property is incident or necessary to it, without the consent of the property owners.

Insurance.—The report of the Insurance Commissioner for 1894 was published in September. The life companies of the State issued 4,637 policies, insuring \$11,033,303, an increase over the business of the preceding year of 355 policies and a decrease of \$250,531 insurance. The companies of other States issued 751,180 policies in Pennsylvania, insuring \$165,453,269. The expenditures of Pennsylvania companies in 1894 were \$7,914,311.62, of which \$5,706,427.61 was paid to policyholders.

The report of the joint-stock fire and marine insurance companies of the State shows that there were 38 in 1894; assets, \$42,305,059; liabilities, except capital, \$21,398,170; capital, \$12,052,875; surplus, \$8,855,492; premiums received, \$16,393,262; total income, \$18,296,378; losses paid, \$10,681,144; total expenditures, \$17,496,524; dividends, \$1,157,365; risks in force, \$2,014,562,684.

There was a uniform decrease in fire, marine, and inland risks written, in premiums received, and in fire losses paid. The premiums received by stock companies during the year were \$10,332,492, and the premiums and assessments of mutual companies were \$1,391,096. The losses paid by stock companies were \$5,355,109, and the losses paid by mutual companies were \$1,045,713.

Forest Fires.—The report of the Forestry Commissioner shows that during the year 225,000 acres of woodland were burned over, causing a loss of timber aggregating fully \$1,000,000. Many fences were destroyed by these fires, and 5,000 men were engaged a total of about two hundred and fifty days in extinguishing the flames. The men received for their work in the aggregate \$45,000. Twenty buildings were destroyed by forest fires.

Monuments.—The anniversary of the battle of Brandywine was celebrated Sept. 11 at the old Birmingham Friends' Meetinghouse, the principal point of the battlefield, by the unveiling and dedication of a tablet to Lafayette and a granite monument to Col. Joseph McClellan. The monument was built by Col. McClellan's descendants and the Lafayette testimonial came from the Chester County Historical Society.

A monument erected near Taylorsville to mark the spot where Washington crossed the Delaware river before the battle of Trenton was dedicated Oct. 8 by the Bucks County Historical Society.

Legislative Session.—This extended from Jan. 2 to June 8. Senator Thomas was president *pro tem* of the Senate, and Representative Walton Speaker of the House. About 1,200 bills were introduced, of which 587 went to the Governor and 489 were approved. There were 68 resolutions passed.

One measure that became a law was called

the "Greater Pittsburg" bill. When at least 5 per cent. of the qualified electors petition the Court of Common Pleas in favor of the annexation of one city of the second class to another, the court must order an election to be held, and if a majority of each city votes in favor the annexation shall take place.

For the relief of the Supreme Court in the increasing pressure of business bills were introduced providing for 2 more judges and creating a court of intermediate appeal, to be called the Superior Court, with a membership of 7. Another bill called for 3 more judges of the Court of Common Pleas.

The Marshall bill, repealing the law of 1883, which prohibited the consolidation of competing pipeline companies, was passed in the face of great opposition from western Pennsylvania. A similar bill was passed in 1893, but was vetoed by the Governor.

One of the measures that attracted most attention was that called the "garb bill," which became a law. It prohibits the wearing by public-school teachers of any religious mark, dress, or insignia in the schoolroom. In its first form it made such wearing a misdemeanor on the part of the teacher; but as finally passed it imposed a penalty upon the school official continuing to employ the teacher—a fine for the first offense, and for the second loss of office and eligibility for five years. The teacher is to be suspended for one year for the first offense, and permanently disqualified after the second. Protests were made against the bill in the interest of the Mennonites and Dunkards, of whom there are 50,000 or more in the State, and who wear a peculiar dress, and in that of the order of the Sisters of St. Joseph, who are employed in some public schools. In 1894 an injunction had been applied for, but was denied, to prevent sisters from teaching in the garb of their order in the school district of Gallitzinborough. The Junior Order of American Mechanics was especially active in pushing the bill.

A bill for compulsory education was passed, providing that all children between the ages of eight and thirteen shall attend school at least weeks in each year.

A new judicial apportionment increased the number of judges of common pleas and of the Orphans' Court.

The following relating to educational matters were enacted providing for the establishment of free public libraries in school districts except in cities of the first and second class; to regulate the establishment, classification, and maintenance of high schools.

A Banking Department was created, the chief officer to be a commissioner of banking, appointed by the Governor for a term of four years, at a salary of \$6,000. The duties and powers of the Auditor General in regard to supervision and regulation of banks and kindred corporations are transferred to this department.

A Department of Agriculture was created, with a secretary, deputy secretary, economic zoologist, commissioner of forestry, dairy and food commissioner, and State veterinarian.

Increases were made in the salaries of State officials and employees, and by these and the creation of new offices the addition to State dis-

bursements is stated as being (\$250,000) yearly. As an offset to the increase of expenses in the Banking Department there is a provision in the bill reorganizing the department, which carries with it a special tax upon the institutions under the control of the department. It is believed that this tax will produce enough revenue to make the State the gainer.

The appropriation for the Department of Agriculture was \$9,000 less than in 1893, and that for the care of public buildings and grounds about \$15,000 less. The Governor raised a provision for \$6,000 for payment of expenses of the State Weather-Service Bureau, considering its continuance unnecessary. An appropriation of \$32,000 for expense of a Senate committee in settling a disputed election case was also raised, because it was excessive and not needed. Another item of \$8,000 for the payment of the expenses of the joint legislative committee to investigate the question of convict labor and to what extent it interferes with the legitimate industries of the Commonwealth was disapproved because the amount was excessive and the purpose would not warrant the expenditure. The appropriations were reduced in all from about \$23,000,000 to about \$21,500,000 before they left the Governor's hands.

Appropriations of \$200,000 were made by the Legislature to the State normal schools. It was announced that the Governor intended to veto it, and the veto was filed in the office of the secretary. In a short time the executive was overwhelmed with communications from the managers of these institutions informing him that to refuse the appropriation at this time would be disastrous to the schools. This was a surprise to the Governor, and he notified the managers of the schools by telegraph that if they would agree not to draw more than 50 per cent. of the appropriations until the end of the fiscal year June 1, 1897, and the remainder afterward, he perhaps could give his approval. This proposition was accepted, and two days later he withdrew the veto and approved the bill. The question then arose whether this action was legal. As the Legislature had already adjourned, the bill could not be passed again.

Among other acts of the session were these:

Authorizing boroughs to induce surrounding lands and for that purpose issue and sell new bonds bearing bonds, and to provide a fund for the redemption thereof.

For the protection of German corp in the public lakes and streams.

Making dying declarations competent in prosecutions for criminal abortion and attempted abortion, where the subject shall die in consequence of such unlawful acts.

Authorizing the cities to appropriate private property for public parks.

Providing that some ten citizens of the United States shall be employed on public work.

To define who shall be responsible for the maintenance of patients placed in insane hospitals by courts and judges.

Dividing the cities of the State into 4 classes with respect to their population, and designating the mode of ascertaining and changing the classification thereof in accordance therewith.

To exempt sewing machines and typewriting machines issued or hired from levy of sale on execution or distress for rent.

Making a uniform season in Huntingdon County for killing deer from Dec. 15 to Oct. 15, and squirrels from Jan. 1 to Oct. 15.

Regulating the construction and ventilation of tenement houses.

Making it a misdemeanor punishable by a fine of \$100 or imprisonment not exceeding one year willfully or wantonly to raise a false alarm of fire.

Abolishing the law of 1772 by striking out the provision requiring the kissing of the Bible in the administration of oaths so that hereafter all swearing will have to be done with the uplifted hand or the laying of the hand on the open book.

Punishing pool selling, the receiving or transmitting of bets by telegraph, or aiding in pool selling or betting.

Relating to and regulating the issue and transfer of certificates of stock by companies.

Legalizing the dehorning of cattle.

To honor the United States flag as the national emblem of a free people and to protect it from foreign and domestic insult.

Defining the crime of train robbery and punishing the same.

To prohibit exhibitions of physical or mental deformities in certain public places.

To prevent the interference of unauthorized persons with the electrical conductors and electrical appliances and machinery of companies using, generating, or supplying electricity for light, heat, and power.

Amending the divorce law so as to include indignities to the person of the husband.

Conferring upon municipalities the right of eminent domain for the purpose of appropriating public property for the use of the National Guard.

To regulate the advertising of sales by county commissioners of land bought by them for nonpayment of taxes.

Appropriating \$5,000 for a monument to the Philadelphia brigade at Antietam.

Some important measures defeated were bills for congressional, senatorial, and legislative apportionment, on which the 2 factions of the Republican party were opposed to each other. The Quay faction was against the measure, and defeated it with the aid of the majority of the Democrats.

There were various attempts to amend the ballot law, but these also failed.

A commission was created to ascertain the best methods of utilizing convict labor in the institutions of Pennsylvania so as not to interfere with legitimate industries. Resolutions were passed for the appointment of a joint committee of the House and Senate and 2 disinterested persons to investigate the State institutions to ascertain how many of their inmates are aliens; another to investigate the public and normal schools, and committees to investigate the management of the insane asylums.

Political.—An election was held in November for a State Treasurer and judges for the newly created Superior Court. The activity in politics during the year was mainly confined to the contests between factions in the 2 great parties. Robert E. Wright was elected chairman of the State Democratic Committee in place of Chairman Stranahan. Senator Quay was chosen chairman of the Republican State Committee in place of B. F. Gilkeson, and the 2 factions apparently worked together in harmony thereafter. Gov. Hastings was made chairman of the Republican State Convention at Harrisburg Aug. 28. For State Treasurer Benjamin J. Haywood was nominated, and for Superior Court judges the

6 Republicans appointed by the Governor after the passage of the act—E. N. Willard, Charles E. Rice, James A. Beaver, John J. Wickham, Howard J. Reeder, and George B. Orlady.

The platform declared against free coinage of silver and in favor of protective duties, and charged the Democratic party with bringing on the panic of 1893 and the deficit in the national Treasury. The following resolution also was adopted:

We demand that public office should be for the public benefit, and its term in subordinate positions should be during good behavior. No public employee or officer should be permitted to influence primaries or elections, nor upon any pretense to be assessed upon his salary, and all unnecessary positions should be abolished and expenditures reduced. There should be a uniform basis of valuation of property for public purposes. Corporations enjoying public privileges should pay for them, and schools be divorced from politics and kept absolutely free from political influence and control.

The Democratic Convention was held in Williamsport Sept. 11. Benjamin F. Meyers was made the candidate for State Treasurer. For the judicial nominations the following were chosen: Harman Yerkes, James S. Moorehead, Peter P. Smith, Charles N. Noyes, Oliver P. Bechtel, Christopher Magee. The platform contained the following:

We especially invite the sober consideration of the people of this State to the remarkable factional struggle in the Republican party, a struggle which involved no principle or public policy, but simply the supremacy of factional leaders. The worst arrangement at our hands of Republican misrule falls short of what representative Republican newspapers and leaders testified of each other. The admitted prostitution of the public service, the intervention of corporate influences, the misuse of judicial appointments, and the consequent prostitution of the judiciary, the corrupt use of money in the purchase of delegates, the attempted terrorism at Harrisburg by men of the most abandoned type, fix the high-water mark of political debauchery. It but needed to complete its incomplete infamy the transparent hypocrisy which led a convention thus constituted to adopt "with laughter" resolutions concerning the very methods by which its delegates had been selected.

The Prohibitionists met in Pittsburg June 5, and made nominations, as did also the People's and the Socialist-Labor parties.

The result of the election in November gave the Republicans the State Treasurer and 6 judgeships, the seventh going to the Democratic candidate having the highest number of votes, as provided by the law establishing the court. This was Peter P. Smith, who received 285,882 votes. The vote for Treasurer was: Haywood, Republican, 456,745; Meyers, Democrat, 282,481; Berry, Prohibitionist, 20,779; Dawson, Populist, 7,802; Anton, Socialist-Labor party candidate, 1,329.

PERSIA, an empire in central Asia. The Government is an absolute monarchy based on the laws of the Koran, and hereditary in the Shiite dynasty of the Kajars. The reigning Shah is Nasreddin, born July 18, 1831. The heir presumptive is Muzaffereddin, born March 25, 1853.

The revenue for 1895 was estimated at \$6,300,000. A debt of £500,000 sterling was contracted in 1892 to pay an indemnity for the

tobacco *régie* that was farmed out to a foreign company and afterward canceled. This English loan is secured by the customs receipts of northern Persia, and pays 6 per cent. interest.

The Peruvian army numbers 54,700 infantry, 25,200 cavalry, 7,300 militia, and 5,000 artillery. The number of troops kept under arms is about 24,000.

The imports are estimated at \$26,400,000 a year, and the exports at \$15,600,000. The chief imports are cotton cloth, glass, paper, woollens, petroleum, sugar, iron, copper, coffee, and tea. The exports are opium, silk, pearls and pearl shells, carpets, dried fruits, cotton fabrics, rice, wool, tobacco, arms, guns, cotton, drugs, and trinquamas. The export of opium is about 10,000 boxes, valued at \$3,750,000, sent to Europe for medicine and to China for smoking. The export of silk is about 400,000 pounds; of tobacco, 12,000,000 pounds; of cotton, 10,000,000 pounds; of wool, 7,700,000 pounds. The exports of carpets are about \$740,000 in value.

PERU, a republic in South America. The legislative power is vested in a Congress consisting of a Senate, containing 48 members, and a House of Representatives, containing 109, elected for nine years by indirect suffrage. The right to vote is restricted to male Peruvians twenty-one years of age able to read and write, and other taxpayers, masters of a trade, owners of property, or heads of families. The President is elected by the vote of the nation for four years. The President in power at the capital at the beginning of 1895 was Gen. Andres A. Cáceres, inaugurated on Aug. 10, 1894, whose election was the cause of a civil war.

The republic is 463,737 square miles in extent, with a population now estimated at 3,200,000, exclusive of 350,000 uncivilized Indians. The regular army numbers 2,400 infantry, 1,100 cavalry and artillery, and 2,400 gendarmes. The state railroads have a total length of 800 miles, and there are 1,408 miles of telegraph.

Finances.—The revenue is mainly derived from customs. The foreign debt is £32,000,000, for which and £23,000,000 of defaulted interest new bonds have been issued, secured in the railroads, mines, guano deposits, and lands administered by the Peruvian Company of London. The internal debt amounts to 31,572,500 soles, paying 1 per cent. and quoted at 4½ per cent. of the nominal value. The paper money is no longer legal tender, but is redeemable in internal bonds at the rate of 1 sole for 15 soles of paper money.

The Civil War.—When President Bermúdez died suddenly on March 31, 1894, the second Vice-President, Justiniano Borgoño, an adherent of ex-President Cáceres, who had placed Bermúdez in the presidency and planned to succeed him, took possession of the Government, having the army behind him, while the first Vice-President, Dr. del Solar, a partisan of ex-President Pirola, withdrew to Arica, in the provinces occupied by Chilli, and nominated a rival administration. Cáceres had himself proclaimed Provisional President in May, and went through the form of being elected by Congress in August, 1894. Meanwhile the exiled Pirola returned to Peru and headed a rebellion. His cause gained rapid headway in the north and the

south, while he repaired to the center and raised an army for the siege of Lima, the capital.

In the beginning of 1895 the Cácerists at the capital were in sore need of money and supplies, and although they had the best-trained and best-equipped forces they could not count upon the loyalty of their troops. President Cáceres was authorized by Congress to issue bonds, but there were few purchasers, even at 75 per cent. discount. He made prisoners of all the rich citizens of Lima who declined to subscribe, but soon set most of them free. The increase in the political arrests showed that the Pirolista cause was gaining ground at the capital, as it was in other parts of the country. The insurgents virtually held the northern provinces, and were in full possession of the coast. They occupied several of the coast towns. Their bands were active in the vicinity of Lima. They could draw supplies from most of the productive districts. At the end of January they gained possession of Arequipa, the most important inland town in the south. The justice of their contention that Cáceres was a usurper, whose pretended election was entirely irregular, and that the constitutional executive chief, until a lawful election could be had, was Pedro A. del Solar, appealed forcibly to believers in legality everywhere. Cáceres lost so many of his soldiers by desertion that he impressed unwilling persons into the service. To raise money an excise duty of 2 cents a kilo on sugar was decreed on Feb. 12. A force that was sent to bombard and occupy Arequipa was compelled to give up the attempt. Some of the moderate Cácerists called a conference with the intention of requesting the President to resign in order to avert bloodshed and the possible sacking of the capital, but he prohibited the meeting. In the middle of February Pirola drew his lines closer about Lima and its seaport. For months he had been drilling the mountaineers for the attack upon the city. They were the best material for soldiers in Peru, and they were devoted to him, as he was a commander in whose abilities the men had faith and who was always with them, inspiring confidence and winning their affection by sharing their privations and dangers. Cáceres promised his disponding partisans that he would lead his troops out to meet Pirola, Pauli, and Dorend, but he was afraid to do so lest his forced levies should go over to the enemy in front and the revolutionists gain the upper hand in Lima and fall upon his rear. North of Lima, in Pisco, the Government and the rebel forces were evenly balanced, and farther south, while Cajamarca was held by the revolutionists, Col. Cáceres held the force of Trujillo Sembrado in check in the neighborhood of Chiclayo. Near the center Huancayo and the ports of Illescas and Supe were held by the revolution, and so was the whole center outside of Lima and Callao, which were practically besieged by Pirola from the beginning of January, although the Government forces were as strong numerically as his own, each army numbering about 8,000. South of Lima the Government troops were kept constantly moving by the guerrillas around Puno, and south of that place all was lost to the Government. In Puno and Noyagrus the Pirolistas were received with open arms by the population, as they had

been in Arequipa. When the regular siege of Lima began, on Feb. 19, the Government troops erected fortifications and planted guns. The attack was not made till March 17. The revolutionary troops advanced simultaneously in the night from various points. Favored by a fog, one division passed the Cacerist lines unobserved and penetrated to the center of the city, occupying the church towers and other commanding positions and continuing to advance until a line of communications was formed with the division that entered the city from the opposite side. Another division under Col. Pauli outflanked the Cacerist forces and occupied the towers of the Merced church. Pierola had 2,000 riflemen strongly posted at many points before it was light enough to see or be seen by the enemy. The battle in the streets began in the dark and raged till night fell. Outside the city other Pierolist forces engaged the troops that held the fortified positions. The fighting was resumed on March 18 at five o'clock in the morning and kept up till night, and on March 19 firing began again at dawn and was kept up till noon in a weak and desultory fashion, for the contending forces were reduced to a fraction of their original numbers and all who were left were physically exhausted. The Cacerists were thoroughly demoralized, for they were fired upon by citizens from their houses, partisans of Pierola who had kept arms concealed in spite of police searches. Drunken and barbarous from the first, and now despairing of the battle, they began on the third day to loot the stores and clubs and the houses of the wealthy into which they could force an entrance. The Government forces still held the plaza, the palace, and the fort of Santa Catalina. The Pierolists, still 2,000 strong, were prepared to continue the combat and to burn with petroleum or level with dynamite all obstacles to their progress. The leaders, however, having already won the victory, willingly agreed to an armistice of twenty-four hours when the diplomatic corps intervened to prevent needless carnage and destruction and the pestilence that the putrefying corpses of men and horses threatened to bring upon the city. Before the armistice expired a peace was arranged through the mediation of the papal delegate.

The articles were signed on March 21 by Dr. Luis Felipe Villavan, representing Gen. Caceres, and Enrique Bustamente y Salazar, in behalf of Nicolas Pierola, the terms being that Caceres should resign the presidency and retire to Ancón, and Pierola lay down the command of his army and withdraw to Chorillos, while a Provisional Government should be formed, consisting of 5 men, 2 to be nominated by Caceres, 2 by Pierola, and the fifth selected by the others or, in case of disagreement, by lot. The Provisional Government was to keep its powers no longer than was necessary to hold a general election and install a regular government.

Although the number engaged on both sides did not exceed 8,000, the number of men slain or mortally wounded in the two-days' battle was 1,875, and 1,553 were less severely wounded. The Government troops lost more than double the number that the revolutionary forces did, owing to the hostility of the people. In accord-

ance with the stipulation both armies withdrew from the city to camps outside. An urban guard of 2,000 men was organized to preserve order, composed largely of foreigners.

The Election of Pierola.—The Provisional Government was composed of Manuel Candamo, Ricardo W. Espinosa, Luis Felipe Villaran, Enrique Bustamente y Salazar, and Elias Malpartida. The military ranks granted up to date in either army were confirmed, according to the agreement, but the reorganization of the army was left to the coming Congress. The troops of Caceres received some pay from money advanced to the Provisional Government by the banks and were disbanded. Gen. Caceres did not go to the retreat assigned to him, but took refuge on a French war vessel at Callao, and was afterward conveyed away by a British man-of-war. The political prisoners that were starving in the jails of Lima and Callao were released immediately. The authorities took possession of all arms and ammunition. In the south, Gen. Mas, in the district of Cuzco, and the Cacerist commanders at Pisco and other places still refused to recognize the Provisional Government, but they made their submission before a month passed by. Gen. Mas, who had 2,000 men, remained defiant until after Gen. Pierola, who landed at Mollendo with artillery and cavalry for the purpose of chastising him, had a sharp battle with him for the possession of Cuzco. Import duties on iron, coal, and machinery, and export duties on cotton, India rubber, pitch, hides, cotton seed, sugar, and tobacco, which the Cacerist Government had imposed, were repealed.

Elections took place on July 7, but Pierola objected on account of some irregularity, and new ones were held on July 26, when the same candidates were re-elected. Nicolas Pierola was elected President without opposition for the term ending Aug. 12, 1899. The new Vice-Presidents are Guillermo Billinghurst and Augusto Seminario y Vascones. The new Government had to render satisfaction for the arrest, by Caceres, of a British vice-consul who would not subscribe to a forced loan, and to the German and Spanish governments for similar outrages committed upon their subjects by Gen. Mas in Cuzco. While the Provisional Government was still in authority some American Protestant missionaries went to Cuzco, causing great excitement and indignation among the people, and the local authorities finally expelled them in spite of the decision of Minister Candamo that Protestant worship was protected and that they had equal rights with Catholics. Bolivia demanded that her flag be saluted for a violation of her territory during the civil war, but the Peruvians resented this demand and the Government temporized and finally agreed to submit the question to the arbitration of some other American state.

President Pierola was inaugurated duly on Aug. 12, and on Sept. 9, after the assembling of the new Congress, which met on Aug. 30, he appointed the following Cabinet: Premier and Minister of the Interior, Antonio Bontin; Minister of Finance, F. Bresani; Minister of Foreign Affairs, Meliton Porras; Minister of Justice and Worship, A. Albarracin; Minister of

War and Marine, Col. D. J. Parra. On Dec. 1 a new Cabinet was formed, composed as follows: Premier and Minister of Justice, Señor Barrios; Minister of Foreign Affairs, Ortiz Zevallos; Minister of Finance, Señor Ohlin; Minister of War, Col. Ibarra.

PHYSICS, PROGRESS OP, IN 1895.
Constitution of Matter, etc. Molecules.—Stoney (London Royal Society, May 16) thinks that events go on within the molecules of matter that are so sluggish in affecting its pressure or temperature that only after millions of encounters does any manifestation of loss of energy by conduction become appreciable; while the same events act promptly and actively in other ways, as in chemical action or radiation. These events are those internal motions of the molecule in which during encounters there is some exchange of energy with the external or translational motions, but not a ready and quick exchange, while the same molecules may nevertheless exchange energy promptly and quickly with the ether by radiation. The author adds that electrons, for the most part associated with this class of motions, appear to be primarily concerned in every chemical reaction and in all the phenomena of radiation. Sutherland ("Philosophical Magazine," January), in an article on the laws of molecular force, demonstrates that the expression m^2 , which occurs in the treatment of the attractions of like molecules, can be analyzed into two factors, which are the sum of numbers characteristic of the atoms composing the molecule, whose mass (referred to the atom of hydrogen) is m . This would analyze molecular into atomic attraction. Belief regarding the change of molecular structure with time in certain solids has caused some people to fear that no permanent standard of length can be made, but Rogers (American Association, 1895), as a result of comparisons that extend over five years, concludes that such fears are not well founded.

Mechanics. Absoluteness of Rotation.—Mach, in his "Science of Mechanics," does not accept Newton's distinction between the relativity of motion of translation and the absoluteness of motion of rotation. A review of the work by Greenhill in "Nature," Nov. 15, 1894, has been the cause of wide discussion among mathematicians and physicists, from which it appears that many authorities consider that rotation as well as translation is only relative.

Energy.—Helm (Wiedemann's "Annalen," June), in a "Survey of the Present Position of Energetics," states that the two views of energy that are now struggling for supremacy are that which regards it as a mathematical abstraction and that which considers it to be a concrete reality, filling space and migrating continuously from place to place. One of the chief generalizations of energetics, according to this writer, is the following: "In order that something may happen it is sufficient and necessary that uncompensated differences of intensity exist." Allen (London Physical Society, March 8) has mathematically investigated the motion of what he calls "energy cells," which are the small volumes bounded by the walls of a tube of force and by the two neighboring equipotential surfaces. This motion differs according as the

charged or gravitating particles meet or separate. Mr. Allen calculates what he calls the "energy density" in the medium at the men's surface, and finds it equal to 16 horse-power hours per cubic centimetre.

Elasticity.—Fraun (Wiedemann's "Annalen") has measured the elasticity of solid gelatin solutions, and finds that in no case does the volume change by stretching. Part of the water could be replaced by glycerin, cane sugar, or gum arabic without making any difference, but common salt impaired both the elasticity and the strength of the gelatin solids.

Kinematics of Machines.—Hearson (London Royal Society, May 16) shows that all machine movements, however complex, may be derived from a limited number of simple motions. By attaching to each kind of simple motion a suggestive symbol any complex machine motion may be exhibited by a graphic formula. Thus the turning motion of consecutive pieces when one revolves completely about the other is represented by the letter O, and swinging motion, when one turns through a limited angle relatively to the other, by the letter U. The geometrical limitations of the combinations of such motions are shown to be such that only 14 distinct types of these are possible. The author classifies all simple machine movements as follows: 1, Plane mechanisms, where the pieces move in or parallel to a plane; 2, spherical mechanisms; 3, cylindrical mechanisms; 4, conoidal mechanisms, where the axes of the swinging and turning motions neither meet nor are parallel.

System of Pendulums.—A system of 2 equal pendulums joined by an elastic thread has been studied by L. de la Rive ("Journal de Physique"), who finds that energy is periodically transmitted from one pendulum to the other. The period of this phenomenon equals the ordinary period of oscillation multiplied by a number that is proportional directly to the length and inversely to the action of the thread. After 10 or 12 periods the alternation of periods is scarcely perceptible, and in the end the pendulums tend to move like a rigid system, with constant tension of thread.

Lissajous's Curves.—Quast ("Zeitschrift für den Physikalischen Unterricht") notes for the production of these curves 2 small mirrors attached respectively to vertical and horizontal stretched wires, the period being adjusted by screws carrying nuts mounted behind the mirrors at right angles to the wire.

Liquids. Capillarity.—Van der Maasbrughe (Paris Academy of Sciences, Sept. 26) finds that the great theories of capillarity agree but imperfectly with the facts that are observed in evaporation. Most liquids evaporate spontaneously in air, hence: (1) The density of the superficial layer must decrease outward, contrary to Gauss's and Laplace's theories; (2) The mass of liquid has not an invariable volume, contrary to Poisson's theory; and (3) the superficial layer being continuously renewed, is not in equilibrium, contrary to the theories of most contemporary analysts. The author has elaborated a theory which he regards as free from these objections. E. Kaiser (Wiedemann's "Annalen," December, 1894) has studied the mingling of masses of

liquid by observing the Newton's rings that form between films. Difference of potential hastens the mingling, and Kaiser's experiments show that it does so by increasing the pressure on the intervening air, forcing it out at the sides. With the films that he investigated fusion took place in 3.2 seconds with no potential difference, in 1.4 second with one Daniell cell, and in 0.4 second with 2. With more cells, fusion took place instantly and the films usually burst. Malt  s (Paris Academy of Science, Aug. 5), after a study of the so-called Brownian movement of small particles in a liquid, concludes that it is a capillary phenomenon. G. Quinke (Wiedemann's "Annalen," December, 1894) calls attention to the fact that the forms assumed by combinations of alkalis with oleic acid when brought into contact with water have a remarkable analogy with the configuration of various small portions of the stellar universe, such as portions of Orion, Virgo, and Coma Berenices.

Critical Point.—Pictet (Berlin Physical Society, Feb. 22) is of the opinion that substances must still be in the fluid state at the critical point, for the amount of heat that must be put into the substance, reckoning from absolute zero, is less than the latent heat of the liquid, and solid bodies do not separate from solution at the critical temperature, but do so on a further rise of temperature.

Evaporation.—Lehfeldt ("Philosophical Magazine," November) has deduced from thermodynamic considerations a formula representing the relation between the composition of a mixed liquid and that of the vapor that rises from it. This formula agrees reasonably well with experiment, though new data seem to be needed.

Condensation.—Wilson (Cambridge Philosophical Society, May 13) finds that in dust-free air there is still condensation into a cloud of fine drops after the expansion exceeds a certain critical amount, which point remains constant, no matter how many expansions are made. The ratio of final to initial volume at this critical expansion is 1.258, when the initial temperature is 16.7° C., corresponding to a fall of temperature of 26°.

Solution.—Linder and Picton concluded several years ago that there is no definite line to be drawn between suspension and perfect solution, the difference being only one of degree of aggregation. They have now ("Journal of the Chemical Society," February) strengthened their conclusion by finding that a mixture of a 2-per-cent. arsenious-oxide solution with hydrogen-sulphide water is not only diffusable, but can be filtered through a porous pot. Four grades of such mixtures or solutions have thus been obtained, of which the first contains aggregates that can be seen under the microscope, the second is invisible but not diffusible, the third diffusible but not filterable, and the fourth both diffusible and filterable, though it scatters and polarizes light. Lecoq de Boisbaudran (Paris Academy of Science, July 8) considers that all soluble substances belong to a continuous series, of which the members at one end may dilate on solution while those at the other may contract. Crismer ("Bulletin de l'Acad  mie Royale de Belgique," No. 6) finds that the critical temperature of so-

lution is independent of the amount of either body present. It varies much from one body to another, but is constant for the same body, and for a mixture is sensibly equal to the arithmetical mean of those of the constituents. The surface tension of the lower of two liquids tends toward zero at this temperature and the separation meniscus becomes a plane, hence the temperature may be determined by an optical method. Arctowski (ibid.), by determining the solubility at very low temperatures of some organic compounds in carbon disulphide, finds that the point of fusion of the solvent appears not to be an essential point on the curve of solubilities, as supposed by Etard.

Crystallization.—Lecoq de Boisbaudran (Paris Academy of Science, April 22) shows that crystals may form at the bottom of a solution of greater specific gravity than themselves, the action depending on small variations of temperature. Baudrowski ("Zeitschrift f  r physikalische Chemie," November, 1894) has examined the light that certain salts emit during crystallization, and concludes that it is probably electrical, being due to the union of electrified ions.

Gases. Hygrometry.—A hygrometer based on a new principle is suggested by Dr. J. Verschaffelt ("Bulletin of the Belgian Royal Academy," Nos. 9 and 10). The hygrometric state of the atmosphere may be taken as the ratio of the vapor tension inside a solution to the highest possible vapor tension of water at the same tension, when the solution is neither evaporating nor condensing water from the air. Thus by moistening a weighed piece of blotting paper with a weighed quantity of a solution of a salt of known concentration, exposing to the air, and weighing again, the "equilibrium concentration," and hence the humidity, may be calculated.

Kinetic Theory.—Fitzgerald (London Royal Society, Feb. 7) has attempted to show that Maxwell's theorem of the equal partition of energy among the degrees of freedom of atoms is not, as has been generally held, inconsistent with the various internal movements indicated by gaseous spectra. This is due to the control exercised over the motion of the electrons on neighboring atoms by the intervening ether, so that if, say, 10^6 atoms are thus connected, the motions of their electrons might be defined by 3 co-ordinates, and "if the atoms were spheres there would be 3×10^6 degrees of freedom plus the 3 degrees that define the motion of the electrons. Now, if the total energy be equally distributed among all these degrees of freedom, each atom will have only its share of the electro-motions, and its energy of external motion will only be diminished by 3×10^{-6} part owing to the existence of the internal motion of its electrons." Our calorimetric methods are not sufficiently delicate to detect this diminution. Liveing and Dewar (Paris Academy of Science, July 15) find that observation of the spectra of liquid air and oxygen do not bear out the theory that the increase of intensity of the bands as the square of the density of oxygen is due to the encounters of molecules of ordinary mass, which are more frequent as their free path is diminished. Mixtures of liquid air and oxygen

confirm the law of increase at low temperatures. Solid air shows practically the same character and intensity of absorption as liquid air. A thickness of 0.4 centimetre of liquid oxygen gives a much greater band intensity than 1.0 centimetre of liquid air.

Viscosity.—It has been noticed several times that the viscosity of a mixture of gases is greater than would be expected from that of each of its components. Thus the addition of a little hydrogen to carbon dioxide makes it more viscous, although the former gas is less viscous than the latter. The theory of this action has been worked out mathematically for the first time by Sutherland ("Philosophical Magazine," November), who finds it to depend on the difference of mass of the molecules of the mixed gases.

Acoustics. Combinational Tones.—Ricker and Edser (London Physical Society, March 22) find that under certain conditions difference and summation tones are capable of disturbing resonating bodies, and they regard this as settling the vexed question of the objective or subjective nature of these tones. In one case the resonator was a tuning fork whose vibration was observed by the method of the interferential refractometer. Dr. Burton, at the same meeting, described experiments with two organ pipes, showing that their combination tones varied with the relative distance of the pipes, the observer remaining at the same distance—a fact that argues for the objectivity of the tones.

Comparison of Forks.—Hallock (American Association, 1895) has devised a photographic method of comparing the pitch of tuning forks by clamping each fork before a manometric capsule, bowing it, photographing the flames, and then counting the relative number of vibrations.

Vibration of a String.—Cornu (Paris Academy of Science, Aug. 5) finds that the transverse vibration of a string, no matter how it is excited, is always accompanied by torsional vibrations. The actual vibration is complicated not only by this fact, but also by the usual want of symmetry of the strings about their axes.

Heat. Calorimetry.—Waterman ("Philosophical Magazine," November) has devised a calorimeter that is maintained at a constant temperature after the introduction of the heated body by means of cold water, instead of allowing it to rise in temperature and measuring that rise. This gets rid of the radiation error and eliminates the "water equivalent" of the vessel. The water is dropped in from an inverted copper cone surrounded by ice. For bodies of the same weight and the same initial temperature the specific heat is measured simply by the amount of ice-cold water necessary to cool them to the temperature of the room.

Conduction.—Quick, Child, and Lanphear ("Physical Review," July-August) find that the thermal conductivity of copper varies from 0.921 at -54° to 1.059 at 13° , but the increase is more rapid for the temperatures below zero. The average value for the range -54° to -13° is greater than that for 70° to 170° , so either the results must be affected by some undiscovered source of error or the curve of conductivity has a maximum between -14° and $+70^{\circ}$.

Specific Heat.—Vielle (Paris Academy of Science, April 22) has measured the specific heat of

graphite at high temperatures, and finds that above $1,000^{\circ}$ C. it increases linearly with the temperature. A gramme gives up 2,000 calories in cooling from volatilization to 9° , and M. Vielle calculates from this that the boiling point is $3,600^{\circ}$ C.

Volume Heat.—By this term E. H. Griffiths (Cambridge Philosophical Society, May 15) denotes the capacity for heat of equal volumes at different temperatures. He has calculated it in the case of aniline from the published results of observations, and finds it constant.

Fusion.—Le Chatelier (Paris Academy of Science, Aug. 12) finds that the accepted melting point of gold—that due to Vieille, who made it $1,045^{\circ}$ C.—is a little low. The error does not exceed 20° , and the experimenter advises that no change be made for the present in the pyrometer scales that are based on this melting point. Bruner (Paris Academy of Science, April 26) has studied the specific heat of superheated liquids and finds that thymol and paterocol give specific heats that increase with the range of temperature, when they are cooled without solidification to approximately the same extent below their melting points.

Absorption.—Friedel (Wiedemann's "Annalen," July) finds that when, in a chemical compound, hydrogen, oxygen, hydroxyl, or nitrogen are replaced by sulphur or a halogen, the transmittance of the solution is considerably increased. In homologous series the transmittance is regularly changed by every addition of CH_2 , but the direction of the change depends on the other atoms. The absorptive power depends on the constituents and is independent of the size of the molecule. In isomeric compounds the diathermancy differs not only with the difference of atomic volume of the elementary atoms, but also with the difference of linkage among themselves.

Radiation.—A. M. Porter (London Physical Society, Jan. 11) finds that, contrary to the usual assumption, the "emissivity" or amount of heat that passes outward from unit area per second for 1 degree of excess of temperature is not independent of the size of the body, and also depends materially on the shape of the bounding surface.

Temperature.—Berthelot (Paris Academy of Science, April 16) has devised a method for the measurement of the temperature of gases that is independent of the envelope. It is based on a determination of the density of the gas by means of their refractive indices as shown by interference fringes.

Temperature of Greatest Density of Water.—M. de Coppet ("Annales de Chimie et de Physique") has made a new and accurate determination of the temperature of greatest density of water, and finds it to be 3.982° by the hydrogen thermometer under a pressure of 1 atmosphere.

Light. Absorption.—Dufour and Fremont (Société Vaudoise; reported in "La Nature," Dec. 7) find from experiments on the opacity of carbon that a layer of lampblack $\frac{1}{10}$ millimetre thick deposited on glass will not transmit the sun's light. To darken the whole earth, therefore, it would suffice to reduce to smoke a mass of $\frac{1}{2}$ of a cubic kilometre of carbon. Merrill ("Physical Review," May-June) has determined the dependence of infra-red absorption upon pre-

larization for quartz, Iceland spar, and tourmaline. The transmission curves of the ordinary and extraordinary rays were entirely different in all 3 cases, the difference being especially marked with Iceland spar.

Refraction.—Sir John Conroy (London Royal Society, June 20) has determined the refractive indexes of water at temperatures between 0° and 10° C., and finds that the index increases continuously up to the freezing point, while the rate of increase alters at about 4°, the point of maximum density, and that no formula that represents the variation as a function of the density only can completely express the facts.

Photometry.—Kurlbaum and Lummer (Berlin Physical Society) have made a determination of the unit of light that is based on the light emitted by white-hot platinum foil. To keep the temperature constant for a long period and to be able to re-establish it at any time the ratio of the total radiant energy from the foil to that transmitted by a medium was measured bolometrically. The medium chosen was a thin layer of water in a quartz cell. The errors amounted to 1 per cent., and were due chiefly to air currents on the surface of the foil.

Spectroscopy.—Wadsworth ("Astronomy and Astro-physics," December, 1894) has devised a way of rotating the prism of a spectroscope, where movement of the collimator or of the observing telescope is objectionable, in such way as to retain minimum deviation for the central ray in the field. A mirror having an angular motion equal to one half the change in angular motion of the minimum-deviation ray is introduced somewhere between the slit and the focal plane of the observing lens. In the spectro-bolometer it is in continuation of the back face of the prism. Langley, in a paper on "Recent Researches in the Infra-red Spectrum" (British Association, 1894), reviews the work now in progress at the Smithsonian Institution in this direction, especially the combination by composite photography of several linear representatives of the spectrum to form a single one, on which "we may expect to find only what is permanent and not what is accidental." He concludes that more than 2,000 lines will thus be mapped in the infra-red spectrum. Eller and Valenta (Vienna Academy of Sciences), in a paper summarized in "The Astrophysical Journal," May, have discovered two new spectra of mercury, obtained by passing an electric spark through mercury vapor that is distilling at low pressure through a capillary tube. If a large number of Leyden jars are in circuit, the spectrum has a great number of fine, sharp lines; if not, it becomes a series of bands with edges toward the red. The band spectrum corresponds to a slightly lower temperature than the line spectrum. Galitzin (Wiedemann's "Annalen," September) considers the molecular theory of the broadening of spectrum lines superior to those based on Doppler's principle, on Kirchhoff's law, or on damping, since it admits of a development based on the theory of molecular resonators. The broadening is a consequence, according to this, of forced vibrations produced by molecular collisions. The theory explains the unsymmetrical broadening and the influence of temperature and pressure. Evershed ("Philosophical Magazine," May) finds that the vapors of iodine,

bromine, chlorine, sulphur, selenium, and arsenic all glow by external heating, but give continuous spectra. Dense sodium vapor acts in the same way, but on a reduction of density it gives a discontinuous spectrum. The experimenter is satisfied that his precautions precluded the possibility of any chemical action, so that the spectrum was due to true external heating.

Polarization.—Landolt ("Sitzungsberichte" of the Berlin Academy, No. 38) has devised a simple method of obtaining lights of different wave lengths for use in polarimetric work by passing white light through absorption cells. The resulting light, though not actually monochromatic, gives a uniform tint in the field of the polarimeter if the rotation be less than 20°. R. A. Millikan ("Physical Review," September-October) has investigated the polarization of the light emitted by incandescent bodies, and finds that it is a minimum with rays emitted normal to the surface and a maximum with a grazing emission, which indicates that the vibrations are in a plane at right angles to the emitting surface. In the following issue he studies the phenomena qualitatively and finds a striking agreement between the measured amounts of polarization at different angles of emergence and those calculated from Cauchy's theory of metallic reflection on the assumption that the polarization is due to the refraction of rays coming from the interior on emergence. The agreement is especially good in the case of molten silver. The fluorescent light developed at the surface of uranium glass is polarized in much the same way, and the fact is explained similarly by the author. Uljanin (Berlin Physical Society, March 8) has investigated the polarization that is due to oblique radiation from silver, platinum, and black glass, and finds that curves arrived at by assuming that the radiation of the substance is determined by its refraction correspond well with those obtained by direct experiment, especially in the case of silver.

Rotary Polarization.—Rodger and Watson (London Royal Society, June 20) have attempted to determine in absolute measure the magnetic rotation of liquids at different temperatures, the effect of the chemical nature of the liquid on this property, and its correlation with other physical properties. They conclude that the usual measure of the molecular rotation, which involves the properties of water, is particularly ill suited for the purposes to which it is applied, since the behavior in water is exceptional and its rotation is small. In all of the 10 liquids that they examined, except water, the relation between rotation and temperature is linear, and the quotient of the rotation by the density diminishes with increase of temperature. Siersema (Amsterdam Academy of Science), with currents of 35 to 65 amperes, has been able to obtain in oxygen a magnetic rotary dispersion of 3° to 4°. A series of measurements were also made on atmospheric air and values for nitrogen were deduced therefrom.

Luminescence.—E. Wiedemann and Schmidt (Wiedemann's "Annalen," April) draw an important distinction between physical and chemical luminescence. When there is a prolonged afterglow the phenomenon is probably chemical. Luminescence under cathode rays is always ac-

accompanied by chemical action. The same experimenters (*ibid.*, October) find that the luminescence of what Van't Hoff has called "solid solutions" of manganese sulphate in other sulphates depends little on the concentration, but much on the solvent. The lower the temperature the brighter the light. The spectrum is always a continuous one composed of one band. Protot and Altshel ("Zeitschrift für Physikalische Chemie," Vol. XV, Part III) have studied phosphorescence at very low temperatures, and find that it does not take place below -65°C . and that a phosphorescing substance cooled below this point ceases to glow, although the glow begins again when the temperature rises above this point. Knoblauch (Wiedemann's "Annalen," February) finds that there is a constant ratio between the intensity of fluorescence and the existing light, even when the intensity of the latter is altered in the ratio 1:6,400. Variation of the solvent has a great effect upon the various fluorescent bodies. Witz (Paris Academy of Science, Aug. 5) finds that lighting with a vacuum tube in circuit with a Holtz machine or a Ruhmkorff coil gives less heat with the light than any other known means; yet the energy expended per candle power is greater with the present apparatus.

Dichroism.—Behrens (Amsterdam Royal Academy of Sciences, May 25) has observed strong dichroism on flax and hemp fibers that have been dyed with Congo red, benzo-azurine, or with most other tetrazo dyestuffs that are used for dyeing cotton, whereas with naphthol orange, eosine scarlet, and similar dyestuffs no dichroism was observed. The phenomenon seems to be complex and not explicable by assuming a combination of ordinary absorption with common double refraction. The substances experimented upon are as follow, in the order of decreasing ease of becoming dichroic: Flax or hemp, straw, cotton or wood, silk. Wool can not be made dichroic. Their order of decreasing polarizing power is slightly different, as follows: Flax or hemp, silk, straw, cotton.

Flames.—König and Rubens (Berlin Physical Society, May 10) have investigated the distribution of energy in the spectrum of flames. In a triplex burner the energy of the extreme red was found to be more than a thousand times as great as that of the blue. The light from a cloudless sky had greater energy at the blue end, while that from a cloud had its energy nearly evenly distributed.

Localization of Photographic Action.—In 1890 Wiener demonstrated that in a photographic film the photographic action of a stationary light wave is a maximum at the antinodes of Fresnel's vibration vector. This has been generally held to prove that Fresnel's theory is correct, since the photographic effect should be greatest at the places where the vibration is most intense. Larmor ("Philosophical Magazine," January) holds, on the contrary, that there is no reason for supposing that the action would take place at the antinodes rather than at the nodes, and he endeavors to reconcile Wiener's observations with MacCullagh's theory. Using the language of the electric theory, the antinodes of the electric force, which tends to pull asunder the constituents of a molecule, are places where

decomposition, as in photographic action, takes place, while at the intermediate antinodes of the magnetic force the ultimate individual atoms may be distorted, but there is no tendency to separation of constituents. Regarding the electric vibration vector as identical with Fresnel's and the magnetic with MacCullagh's we have a complete explanation of the facts with a reconciliation of both theories.

Visibility.—Pettinelli ("Nuovo Cimento"), in a new determination of the lowest temperature of visibility, finds that a cast-iron cylinder vanishes at 404° . Highly sensitive substances, such as some gas-light mantles, become visible at the same temperature, but reflecting surfaces had to be heated 20° higher before they appeared to the eye, and glass still more. The smaller the surface, moreover, the higher the temperature required for visibility, which fact probably accounts for previous contradictory results.

Wave-length Standards.—The length of the metre has been exactly determined in wave lengths of the red-cadmium line by Michelson, at the observatory near Paris at the invitation of the International Bureau of Weights and Measures. The mean of two wholly independent determinations gave as the equivalent of the metre in wave lengths 1,583,100.5, the deviation of each result from the mean being very nearly 1 part in 2,000,000 ("Travaux et Mémoires du Bureau International des Poids et Mesures," xi, p. 84).

Electricity. Resistance and Conductivity.—Schuster ("Philosophical Magazine," February) deduces the following important laws regarding the measurement of electrical resistance: 1. With a given resistance and a given galvanometer, the ratio of the smallest change of resistance that can be detected to the sum of the given and galvanometer resistances is equal to the ratio of the smallest current that can be detected by the galvanometer to the maximum current which can be sent through the resistance. 2. With a given conductor and a given type of galvanometer, the smallest change per unit resistance that can be measured is given by twice the ratio of the smallest current that can be detected by means of a galvanometer of the same resistance as the one to be measured to the greatest current that can be sent through the galvanometer. 3. The highest percentage of accuracy with which a given resistance can be measured is directly proportional to the square root of the maximum electric work that can be done on it without overheating. Biernacki ("Journal de Physique," October) has devised a new method of measuring the resistance of an air gap during the passage of a spark. It is based on the principle that when, with a Hertzian resonator in contact with an exciter, the forced and natural vibrations interfere so as to destroy each other, the resistances of exciter and resonator must be equal. For a spark gap of 1 centimetre he thus found the resistance to be between 300 and 600 C. G. S. units, while for one of only 0.4 millimetre it was between 1,200 and 1,500. Not only does the resistance increase with diminution of the spark length—an unexpected fact—but other properties of the spark alter. A short spark is usually violet-colored and ramified, and a longer one is white and straight, with a sharp noise.

Sanford ("Physical Review," November and December) has extended his former observations on the dependence of resistance upon the surrounding dielectric, which have been severely criticised ("Annual Cyclopædia," 1893, p. 621, and 1894, p. 635). His original results have recently been verified qualitatively by Grimaldi and Catania. Further observations on silver and copper wires show that the amount of change of resistance differs with different samples of wire, but is constant in direction for the same material. Thus the resistance of copper was less in petroleum than in air, while that of silver was less in air. The behavior of a copper-plated silver wire was almost identical with that of pure silver. B. O. Peirce (American Academy) in experiments on the resistance of poor conductors, such as different kinds of wood and stone, obtained the following results in megohms:

MATERIAL.	Minimum.	Mean.
Mahogany	310	610
Hard pine	17	1,051
White pine	360	1,470
Vulcanized fiber	3	61
Slate	184	250
White marble	2,000	8,500

The wood was all well seasoned and the resistance was measured with the grain. Across the grain it was 20 to 50 per cent. higher. The stone was sun dried for three weeks before testing. Gin and Leloux (Paris Academy of Sciences, April 29) find that the resistance of saccharine solutions depends on the concentration and temperature, and is also a function of the current density. R. Colson (Paris Academy of Sciences) finds that Ohm's law does not hold in the case of the propagation of waves of high potential, as from the secondary of an induction coil, in high resistances, such as threads saturated with a solution of calcium chloride or capillary tubes filled with water. Tuma ("Wiener Berichte," June 14) has determined the resistance of copper, German silver, nickel, and iron wires for oscillating currents. The results agree approximately with the formulas obtained by Stefan, and for alternating currents of high frequency the agreement was more complete for nonmagnetizable conductors. For magnetic substances the variability of the permeability renders calculation illusory. With iron wire the resistance decreased as the current strength increased. J. W. Rodger describes in "Nature," Nov. 8, 1894, the experiments of Kohlrausch and Heydweiller on the electric conductivity of pure water, a constant for which widely different values have been found. They measured at 18° the temperature rate of change for a series of samples of water of different degrees of purity and also the conductivity of two samples of very pure water at -2° and 50°. Assuming that the observed conductivity was really the sum of that of pure water and a dissolved impurity, they made use of the theoretical rate of change at 18° to obtain the conductivity of absolutely pure water, which they find to be 0.0001 at 18°. The smallest value actually observed was 0.0404, so that the almost infinitesimal quantity of impurity present changed the conductivity by about 10 per cent. Warbrug Wiedemann's "Annalen," March) is of the opin-

ion that the alteration of conductivity that is produced by an electric current in aniline and similar bodies, and the convection phenomena that they exhibit, may all be explained by supposing them to be very dilute solutions of an electrolyte. The similar behavior of xylol, benzol, turpentine, etc., is probably due to the same cause. Sadovsky ("Journal de Physique," April), in investigations on the influence of magnetic fields on electrical resistance, finds that the difference in the resistance of bismuth observed with constant or alternating currents is measurable outside a magnetic field with a frequency of 30 a second, and can be detected in magnetic fields with a frequency of only 3 or 4. The difference depends on the frequency, and without a field increases with the frequency. Bismuth in strong magnetic fields offers to an increasing current a greater resistance, and to a decreasing current a less resistance than that for steady currents. The difference of the resistances to increasing and decreasing currents increases with the rate of change in the strength, and this difference is more marked with strong currents than with weak ones. The results can not be due to self-induction, or they would occur outside a magnetic field. Pringsheim (Berlin Physical Society, April 26), from experiments on the conductivity of heated gases, finds that the farther apart the electrodes the less the current, while with constant distance the current decreases with the time. Polarization was quite perceptible for a half hour after breaking the current. He concludes that the phenomenon is electrolytic. Vincentini and Cinelli ("Nuovo Cimento," Vol. XXXVI, No. 3) have experimented on the transmission of electricity through the gas surrounding a wire made red hot by an electric current. The results depend on the gas and show, in the opinion of the authors, that in the case of hydrogen the gaseous molecules that leave the surface of an incandescent platinum wire are positively electrified, their potential being about 0.25 volt higher than the mean potential of the wire. With air and carbon dioxide the excess is still greater, being about 1 volt. With hydrogen at a high temperature an inversion of the phenomenon takes place. J. J. Thomson (Cambridge Philosophical Society, Feb. 11) has devised a method of measuring the conductivity of badly conducting substances by placing a sphere of the substance to be measured within a coil that is traversed by rapidly alternating currents. A second coil connected in series with the first incloses an exhausted bulb. The introduction of the sphere into the first coil causes by induction a change in the currents, and hence an alteration in the glow of the bulb, by observing which the sphere's conductivity is obtained. Branly (Paris Academy of Science, April 22) shows that certain pairs of metals, as copper-zinc, have no contact resistance.

Specific Inductive Capacity.—Pellat ("Journal de Physique," November) has devised an instrument for measuring specific inductive capacity in either liquids or solids. It consists essentially of two attracted disk electrometers in which the two movable disks are rigidly connected, and the two attracting disks are electrically connected; one of the latter is movable by a micrometer screw. The two former are attached

to the arm of a delicate balance. The substance to be examined is placed between the fixed attracting disk and its movable disk, and the position of the movable attracting disk is observed. With this instrument the specific inductive capacity of mica has been measured from a plate only 0.013 centimetres thick.

Condensers.—Sheldon, Leitch, and Shaw (*Physical Review*, May-June) find that certain types of platinum-sulphuric-acid cells, when charged to potentials less than the electro-motive force of polarization act as condensers, whose capacity depends upon the impressed electro-motive force as well as on the electrodes. Considerable hysteresis is present in the relation between potential and charge. These cells are of large capacity, but the high-temperature coefficient and low efficiency prevent their practical use.

Electro-motive Force.—Gouré de Villemontée (*Paris Academy of Science*, Dec. 24, 1894) has studied electric potentials in a uniformly moving liquid conductor, and finds that at speeds of 33 to 323 millimetres a second such movement produces no appreciable potential difference between two points in the liquid.

Glue Discharge.—A. Herz (*Wiedemann's "Annalen,"* February) finds that the potential gradient in the positive unstratified discharge of a vacuum tube decreases with increase of the current, and also with increase of the tube's diameter. It increases with, but not as rapidly as the pressure. Mebius (*ibid.*, March) finds that the straight lines that represent the relation between current and potential difference for different distances between the electrodes in a glow discharge in air are not parallel, the divergence increasing with the extent to which the air has been modified by the current. The changes are shown spectroscopically to be probably due to formation of nitric oxide.

Dielectrics.—Gony (*Paris Academy of Science*, July 1) has investigated the apparent attractions and repulsions of electrified conductors in a fluid dielectric, and finds that they result (1) from mutual attractions and repulsions of charges, just as in a vacuum; and (2) from the hydrostatic pressure produced by the force that attracts the dielectric in the sense where the intensity of the field increases most rapidly.

Primary Cells.—Korda (*Paris Academy of Science*) has made a "thermo-electric carbon cell," depending on the fact that if barium peroxide is heated red hot in contact with carbon the oxide is reduced, and a difference of potential of about a volt is produced. Borchers (*German Electro-chemical Society*, see "*Nature*," Dec. 6) has produced an electric current by what he calls the "combustion" of carbon monoxide. He constructed a cell of which one plate was a carbon bell, the place of the other being taken by streams of the gas introduced through copper tubes. Oxygen was introduced within the bell, and an ammoniacal or acid solution of cuprous chloride served as electrolyte. An electro-motive force of 0.3 was obtained, corresponding to about 15 per cent. of the energy due to the oxidation of carbon.

Storage Batteries.—The recently introduced chloride battery possesses, it is claimed, the advantages of earlier types without many of their

disadvantages. A mixture of the chlorides of lead and zinc is formed into tablets, around which is cast a frame of antimony lead. The chlorine and zinc are then eliminated, leaving a porous structure of pure crystalline lead of good conductivity and large exposed surface. The battery's capacity is large in proportion to its weight and to the space that it occupies. Lucien Poincaré (*Paris Academy of Science*) has endeavored to obtain a secondary battery with liquid metallic electrodes, with a view of reducing the losses that occur in the ordinary lead accumulator. He used mercury and a solution of a salt, forming an amalgam as the cathode. With the haloid salts of the alkaline metals he obtained an electro-motive force of 2 volts, an efficiency of nearly 90 per cent., and a capacity per kilogramme of about 10 ampere hours. The cells may be completely discharged without deteriorating in any way.

Voltameter.—Naber (*London Physical Society*, March 8) has devised an improved voltameter in which either the oxygen or the hydrogen can be collected separately and the level of the liquid inside and outside the burette can be equalized, obviating the necessity for correction for difference of level. Christiansen (*Wiedemann's "Annalen,"* November, 1894) holds that electricity can not be generated by friction alone, but is due to chemical decompositions begun at contact and complete on separation. This view is confirmed by experiments on the contact of mercury with various insulating linings of a tube. Jaegerman (*Wiedemann's "Annalen,"* August) finds that the potential that leads to a spark discharge depends on several elements besides thickness and nature of dielectric, especially on variations of electric force which hasten the discharge and lower the necessary difference of potential. The spark gap is also affected by previous sparks and by a delay in discharging.

Electrification of Air.—Kelvin, Macdon, and Galt (*London Royal Society*, March 10) find that positive or negative electricity that is given to air by an electrified needle point can be conveyed through 3 or 4 metres of small metal tube and shown on a quadrant electrometer by a receiving filter. In general air electrified negatively when passed through a metallic wire-gauge strainer gives up some, but not a large proportion of its electricity.

Alternating Currents.—Foucault ("Comptes Rendus," April 22) has devised an optical method for observing the characteristics of an alternating current. By viewing through a polariscope the changing field of light due to the passage of such a current through a coil that surrounds a suitable medium of transmission, and by using a stroboscopic method, the change can be caused to take place apparently as slowly as desired, and from it all the peculiarities of the current can be deduced.

Electro-magnetic Waves and Radiation.—Trowbridge and Drake ("American Journal of Science," April), from experiments on a new method of measuring the velocity of electrical waves, conclude that if it appears, as theory seems to indicate, that electric waves travel in air with the velocity of light, it may be that the latter velocity can be determined more accu-

rately by an electrical and photographic method than by the eye methods which have hitherto been used. The same experimenters (*ibid.*, August) find the velocity of electric waves traveling along two parallel wires to be 3.0024×10^{10} centimetres per second—a value that differs from the velocity of light by less than 2 per cent., and from the ratio between the 2 systems of electro-magnetic units by even less. Garbasso and Aechkinass (Wiedemann's "Annalen," November, 1894) have made a prism capable of refracting and dispersing electro-magnetic radiation by fastening resonators made of tinfoil on a series of parallel glass plates. The rays were deflected by angles differing with the wave length. They conclude from their experiments that the rays of electric force are not necessarily to be regarded physically as monochromatic, but as compound with as much justification as ordinary light. Helmholtz's theory of color dispersion acquires fresh support from their experiments. Yule ("Philosophical Magazine," April) has investigated the passage of a wave train from an oscillator through a conducting dielectric, and finds that the intensities of the reflected rays, the phase changes, etc., for damped wave trains reflected from such a plate differ very considerably in some cases from those for steady rays. Bjerknes (Wiedemann's "Annalen," January) concludes that in the phenomena called "multiple resonance" there are not as many stationary wave systems as there are nodal systems exhibited by the resonator, but that these periods are due to the resonator, which resounds to a simple oscillation at different points. The difference between electric waves and light waves he regards as lying in the fact that the former are damped, while the latter are maintained. Mack (Wiedemann's "Annalen") has demonstrated that electric waves are doubly refracted in wood, the velocity of propagation being different across and along the fibers. His experiment was analogous to the common optical experiment of restoring the light intercepted by 2 Nicol prisms with their principal planes at right angles by inserting a doubly refractory substance, as a tourmaline, between them. The Nicol prisms were represented by Hertzian concave mirrors with crossed focal lines and the tourmaline by a plate of wood 10 inches thick. Bjerknes (Wiedemann's "Annalen," May) has deduced several new laws of electric resonance. He finds that the secondary spark potential is proportional to the square of the period of the resonator, the magnetic or thermal integral effect to its cube, and the electric integral effect to its fifth power. Aechkinass (Berlin Physical Society, Nov. 30, 1894) finds that tinfoil gratings placed near a Hertz exciter show diminished resistance that is quite independent of the action of the light of the primary sparks. It persists after the cessation of the oscillations, but resumes its original value on percussion.

Mizano ("Journal," College of Science, Tokio; reported in "Nature," Nov. 21) has experimented on the tinfoil grating as a detector. On exposing to radiation of about 60 centimetres' wave length 2 gratings whose resistances were respectively 130 and 232 ohms, the resistance fell in some cases as much as 11 and 42 ohms respectively, but it was nearly restored to its former

value by gentle tapping. The angle made by the plane of polarization of the radiation with the strips of the grating influences the resistance, which is greatest when the strips are perpendicular to the plane of the primary oscillations. The author concludes that the change is a mechanical one, and thinks that it may be due to small points on neighboring strips being brought into contact by the electric radiation. J. Klemencic (Wiedemann's "Annalen," December, 1894) explains the strong damping action of magnetizable metals upon electric oscillation by their circular or transverse magnetization, which crowds the oscillations into the surface layers more than with other metals. Hence the resistance of a magnetizable wire to electric oscillations is much greater than that of another wire of equal conductivity. Drude (Wiedemann's "Annalen," February) has investigated the relation between a substance's dielectric constant and the period of the electric waves that traverse it, which he calls the "electric dispersion." For alcohol, this quantity is normal and of the same order of magnitude as the optical dispersion. Water showed abnormal dispersion, and ebontite none at all that was perceptible. Ounes (Amsterdam Royal Academy, Sept. 28) reports as the result of experiments on electrical waves in water (1) that there is no dispersion for waves of the frequency of 27,000,000 to 97,000,000 a second, and (2) that the refractive index for waves of which there are several hundred millions a second equals the square root of the specific inductive capacity measured statically.

Photo-electricity.—Elster and Geitel (Berlin Academy) have constructed a photo-electric cell, consisting of an exhausted glass globe with an anode of platinum wire and a cathode of sodium-potassium alloy. When the cell was illuminated by light from incandescent zircon, polarized by passage through a Nicol prism, the current that passed through it when its terminals were connected to a 400-volt battery was found to depend in strength upon the angle of incidence of the light and on its plane of polarization, being greatest when the plane of polarization was perpendicular to the plane of incidence and when the angle of incidence was about 60° —the polarizing angle of the alloy. Branly (Paris Academy of Science), in studying the rate of loss of a charge from the effect of light in the case of badly conducting bodies, finds that when the light is from a body heated to a dull red the condition of the illuminating surface plays the chief part in the phenomena, the nature of the charged body having no effect. But if the light is rich in the highly refrangible rays, the effect depends on the illuminated body, but in nearly all cases this loses electricity. With wood, marble, cardboard, terra cotta, and hot glass, a negative charge is lost more rapidly than a positive one, while the opposite is the case with wood or metal varnished or coated with oil, paraffin, or tallow.

Cathode Rays.—Kowalski (Paris Academy of Science, Jan. 14) finds that the production of so-called cathode rays does not depend on the discharge from metallic electrodes across a rarefied gas; that they are produced chiefly where the primary illumination attains a considerable intensity; and that their direction of propaga-

tion is that of the current lines at the places where the rays are produced from the negative to the positive poles. Lenard (Wiedemann's "Annalen," October) finds that the ratio between the absorptive power for cathode rays and the density is the same for all media, whatever their state of aggregation, provided the cathode rays are of the same kind. Goldstein ("Sitzungsberichte" of the Berlin Academy, No. 55) notes some curious changes of color in salts under the influence of cathode rays. Potassium chlorate, whose behavior is typical, assumes a heliotropic shade when caused to phosphoresce in a radiation tube and eventually turns violet. On heating, the color becomes blue and finally white. Under ordinary conditions the hue fades gradually, disappearing in about a week. The author thinks that neither impurity nor chemical decomposition will explain the phenomena, and inclines to the opinion that a physical modification is brought about by change of position and motion of the molecules, due to the radiation.

The Hall Effect.—Lebrat (Amsterdam Royal Academy of Science, April 18) finds that the Hall effect is dissymmetrical in bismuth under certain circumstances, when the primary electrodes are not attached in accordance with 2 perpendicular directions that exist in every plate. Van Aubel (Berlin Physical Society, April 26) has investigated the Hall effect in thin layers of bismuth deposited electrolytically. He explains the asymmetry of the phenomenon on refusal of the magnetic field as due to the influence exerted by that field on the metal's electric conductivity. Wind (Amsterdam Academy of Science) supposes the electric current to consist of 2 components of unequal electro-motive force—a current of conduction and a displacement current. This hypothesis accords with observation, provided we suppose that the specific resistance of metals for very rapid periodic currents exceeds that for continuous currents.

Electric Arc.—Lehmann (Wiedemann's "Annalen," June) finds that there is no fundamental difference between the arc and discharges in rarefied gases, and that the current travels not only through the arc proper, but also through the surrounding aureole. L. Thomas (Paris Academy of Science, Oct. 29, 1894) finds that the voltaic arc between carbons that contain metallic salts consists of a nucleus surrounded by an envelope, the former giving band spectra due to hydrocarbons, and the latter metallic line spectra due to burning of dissociated salts in passage from the positive to the negative pole. Deslandres (Paris Academy of Science, June 10) has made a spectroscopic study of the carbons of Moissan's electric furnace, and finds that the carbon growths on the negative pole are of a high degree of purity, owing to the dissipation of the more volatile impurities at the high temperature that is obtained. Wilson (London Royal Society, May 30) has investigated the effect of gaseous pressure on the temperature of the crater of an electric arc light, and finds that as the pressure increases the temperature decreases, instead of increasing, as it would if the carbon in the crater were at the boiling point. He concludes that the temperature of the crater, like that of an incandescent filament, depends

on how much it is cooled by the surrounding gas. These experiments are in accord with the belief that the films phosphoresce at 5,000° contain clouds of solid carbon particles, which it could hardly do if carbon boiled at the temperature of the arc or 3,500°.

Electrolysis.—Andrews ("Le Globe," June 29) has described what he calls indirect or secondary electrolysis of a liquid. In a bath of three compartments separated by porous porcelain he places two conducting liquids, one in the two end compartments and the other in the middle. If the electrodes are now immersed in the end compartments, the liquid therein is decomposed, while the other liquid remains unchanged. If, however, in addition, one or more metallic plates are immersed in the central compartment, without connecting them with either pole, the middle liquid is decomposed, while the end ones remain unaffected. J. J. Thomson ("Nature," Sept. 5), in experiments on the electrolysis of gases, finds distinct evidence of polarization, as in liquids. The difference in the spectra at the two electrodes when a discharge passes through some elementary gases is explained by the author as due, partly at any rate, to the difference in the properties of a positively charged and a negatively charged atom. Myers (Wiedemann's "Annalen," July) finds that the gases dissolved in the electrolyte of a silver voltameter influence the amount of silver that is deposited. Air lessens it about 1 per cent., and carbon dioxide still more, while nitrogen affects it less.

Magnetism. *Magnetization.*—Curie ("Journal de Physique," June, et seq.) has examined the magnetic properties of substances in fields of from 25 to 1,250 C. G. S. units and at temperatures in some cases of 15° to 1,250° C. The bodies were coarsely pulverized and placed in glass bulbs. On the magnetism of diamagnetic bodies, bismuth and antimony excepted, temperature was practically without effect. Fusion and allotropic modification also have no effect except with selenium and phosphorus. The susceptibility of bismuth increases steadily with the temperature up to the melting point, when there is a sudden rise. After fusion it remains constant and nearly at zero. With solutions of paramagnetic salts the susceptibility varies inversely as the absolute temperature. Silver is feebly diamagnetic when cold, but strongly so when hot. The author regards glass as a mixture of a diamagnetic substance that is unaffected by temperature and a small quantity of a paramagnetic substance whose magnetism weakens as the temperature rises. The susceptibility of iron at first decreases, but between 300° and 1,250° it is almost constant, and it then suddenly increases by about 50 per cent., afterward gradually decreasing up to 1,250°. M. Curie explains this by supposing iron to behave like any other paramagnetic body up to 300°, and then to begin to change into a second allotropic form, completing the change at about 350°, and remaining in the new form to 1,250°, behaving like such a body as oxygen or palladium. At 1,250° there is a sudden reversion to the primitive condition. Mondoy (London Royal Society, Jan. 17), from experiments on slow changes in the magnetic permeability of iron, concludes that such changes

are not due to fatigue caused by reversals, and that neither magnetic nor electric action are necessary to produce them, but that they result from long-continued heating at a low temperature, being greater if the heating is accompanied by pressure and not occurring when the rise exceeds a few degrees. Schmidt (Wiedemann's "Annalen," May) finds that steel follows weak magnetizing forces more quickly than iron. For fields less than 0.06 C. G. S. units the susceptibility of soft steel is to that of iron in the ratio of 4 to 3. For fields of one unit the susceptibilities are nearly equal, but for greater fields that of iron is the greater. Weiss (Société Française de Physique) finds that the permeability of crystallized magnetite varies with the inclination of the magnetizing field to the crystallographic axes. If the results are expressed by drawings from a given point radii vectors of such a length that each represents the magnetization of the specimen in its own direction when saturated, the surface in which all the ends lie is a cube with rounded edges and slightly hollow faces. These facts seem to show that the theories that regard magnetization as the result of the orientation of particles of fixed magnetic moment are insufficient to explain the magnetization of crystals.

Elongation.—Moore ("Physical Review," November to December) finds that the maximum elongation produced in iron wire by magnetization occurs at an intensity of about 1,200. Beyond this point the elongation diminished.

Induction.—Leecher (Wiedemann's "Annalen," February), in a paper on unipolar induction, discusses the question whether, when a cylindrical magnet turns around its axis, the lines of force are stationary, as Faraday thought, or turn with it, as maintained by Tolver Preston and others. Previous experiments, according to the author, may be interpreted either way, but some recently performed by himself show that the former view is the correct one. Hopkinson (Royal Institution lecture) suggests that, since in an electromagnet as large as the earth the reversal of the current in its coils would cause disturbances that would require thousands of millions of years to reach their maximum value at the center, it is conceivable that the earth's magnetism may be due to currents in its material sustained by its changing induction, but slowly dying away.

Electro-magnetic Pulling Force.—Weber (Wiedemann's "Annalen," January) finds that an iron wire whose length is very great relatively to its thickness experiences a pulling force proportional (1) to the intensity of the field, (2) to its magnetization, and (3) to its section, when its end is in a magnetic field and its axis is parallel to the force lines. When lying across the force lines it experiences a force similar but less in a ratio that is about 100 in moderate fields, but quickly approaches unity as the field grows in strength.

Magnetism and Elasticity.—Bock (Wiedemann's "Annalen," March) finds that by magnetization the constants of elasticity of soft iron are altered by an amount not exceeding 0.5 per cent. Flexure and torsion diminish, and the ratio of sectional contraction to longitudinal expansion increases. Iron becomes more incompressible in the magnetic field.

Mirrors of Magnetism.—Thompson and Walker ("Philosophical Magazine," February) finds that a plate of iron gives a magnetic image analogous to the optical image produced by a mirror, and geometrically identical with it.

Direction.—Lagrange ("Bulletin of the Belgian Royal Academy," No. 1) states that in practice the orientation of a magnet does not depend alone on the direction of the lines of force of the field, as it should by theory, but also upon the strength of its magnetization. He suggests that this is due to some unknown cause, perhaps to a "circulation of the ether."

Miscellany. **Suspension for Physical Instruments.**—Julius (Wiedemann's "Annalen") uses for this purpose a small circular table suspended by 3 vertical wires. The center of gravity is brought into the plane of the table by a movable weight attached to a rod projecting downward. Any lateral displacement of the upper ends of the wires will start waves down them, which will perceptibly affect the table only when the period of the disturbance coincides with that of the oscillation of the table about the point of suspension, and even then the axis remains vertical.

PHYSIOLOGY. In the concluding part of a lecture on the work of Carl Ludwig, Dr. Burdon-Sanderson has given a brief summary of the doctrine of vitalism as it now presents itself in the form of "neovitalism." The author pointed out that the principle which Ludwig and his contemporaries advanced in the middle of the century as fundamental in physiology—that no explanation of any observed process or event was to be accepted excepting that which consisted in referring it to chemical or physical laws—was now generally admitted, but was then a new one. Before that the current teaching, with exceptions, was in the opposite direction. It was not denied that, in general, things went on in the body as they did out of it: but whenever a phenomenon could not be explained on this principle it was regarded as legitimate at once to have recourse to the hypothesis of a vital force as a way out of the difficulty. A movement had recently sprung up in Germany under the name of neovitalism which at first sight seemed to return to the old position. Several writers had shown a tendency to follow it, and it was the subject of one of the addresses at the Lübeck meeting of the German Association of Naturalists and Physicians. On comparing the position of the neovitalists with the doctrine current fifty years ago, there appears to be a considerable difference between them. There is, in truth, no revival of the hypothesis of a vital force: for it is recognized that if the word force is used to mean something that manifests itself by measurable effects, there is no indication that any force, except such as the physicist recognizes, is in operation in the organism. In the position now taken it is pointed out that in certain recent instances processes of life which were at first regarded as entirely physical or chemical do not conform so precisely as they were expected to do to physical and chemical laws. One of these which is especially worthy of attention is that of the lymphatic system. It had appeared from the investigations of Ludwig and his pupils that the efficient cause of the

movement of the lymph, like that of the circulation, was mechanical. But Heidenhain found in 1890 that the process of lymph formation did not appear to go on in strict accordance with the physical laws by which leakage through membranes is regulated. The neovitalists supposed, to account for this departure, a function of color protoplasm—living beings—which, being placed at the inlets of the system of drainage, let in less or more in obedience not to physical laws, but to vital ones, to internal laws which are special to themselves. The explanation is not sufficient, because, while the activity of the cells in the processes of the animal organism is generally recognized, as it was before the neovitalism appeared, the question as to how they work is still not answered. The problem of lymph formation has been vigorously attacked since 1890, among others by Dr. Starling, of Guy's Hospital, who, by sedulously working out the conditions under which the discrepancies between the actual and the expected had arisen, has succeeded in untying several knots.

The relations of physiology and medicine were defined in an address before the Physiological section of the British Medical Association, by Dr. David Ferrier, who said: "In former days few, if any, would have been found prosecuting the study of physiology who were not also engaged in the actual practice of medicine or surgery. Things, however, have greatly changed. Owing mainly to the division of labor, which the progress of knowledge has rendered a necessity, physiology has become increasingly technical, and tended to separate itself more and more from medicine in its practical aspects. Hence there has grown up a generation of physiologists who have little interest or sympathy with the practitioners of medicine, while we have still, and always have had, a class of practitioners who, though acknowledging physiology to be one of the institutes of medicine, say farewell to its problems and methods when once they have passed their examinations. In both extremes there lies great danger to the best interests of the science of physiology and the science and practice of medicine. The practice of medicine offers not infrequently rare conjunctions of symptoms, and valuable opportunities of research, too often wasted, which a little physiological training on the part of the practitioner might often have turned to good account; and the necessities of practical medicine have been the most fertile source of inspiration of physiological experiment. Much of what might otherwise have remained as vague surmise or, at most, plausible hypothesis, has been raised to the level of verified fact by well-conceived and often simple physiological experiment. The experimental method is, as it were, the keystone of the arch; indispensable, indeed, to the security of the structure the foundations of which have been laid in clinical observation."

Respiration.—The investigation of the relation of the respiratory exchange of cold-blooded animals to temperature by J. M. Vernon was made to test the validity of the supposition that the metabolism of these animals, contrary to what is the case with the warm-blooded, varies uniformly with the temperature. Measurements of the carbonic acid evolved by frogs were made

at temperatures from 0° to 39° C. The author finds that the carbonic-acid evolution by intact frogs on gradual warming varies within narrow limits from 2° up to about 17.5°, but above this point it increases rapidly with the temperature. On cooling, it, as a rule, becomes equally constant from about 17.5° to 12.5°, or 10°, and then decreases uniformly with the temperature. In curarized frogs and frogs with their bulbs injured the carbonic-acid discharge increases uniformly with the temperature. If frogs be warmed and cooled rapidly several times, the curves of carbonic-acid evolution subsequently obtained are either perfectly uniform or show abnormally marked changes at varying temperatures. The curves do not become normal again for several days after. The respiratory quotient of winter frogs in which the bulb has not been injured is about 0.63; that of frogs with the bulb injured, about 0.45; and that of curarized frogs and those subjected to rapid temperature changes, about 0.5.

From his studies of the path of the respiratory impulse from the bulb to the phrenic nuclei, W. T. Porter deduces the following theory of crossed respiration: The respiratory impulse descends the lateral tracts. The fibers which convey it end in terminal arborizations at the level of the phrenic nuclei. The dendrites of every phrenic motor cell may be divided into 2 groups: the one group is composed of dendrites which lie in contact with the terminal branches or end arborizations of the descending respiratory fibers of the same side of the cord; and the other group is composed of relatively few dendrites, and these cross in the protoplasmic commissure to the opposite side of the cord and lie in contact with the end arborizations of that side. The end arborizations of the descending respiratory fibers of each side are therefore in contact with dendrites of different origin—first, with numerous dendrites from the phrenic cells of their own side of the cord; and second, with relatively few dendrites from the phrenic cells of the opposite side. The greater part of each descending respiratory impulse is discharged into the phrenic cells of the same side, because the dendrites offer less resistance to the passage of a nervous impulse than is offered by the relatively small number of dendrites which have crossed the median line from the phrenic cells to the opposite side. The remaining smaller part of the descending respiratory impulse is discharged into the crossed dendrites, and is conducted by them to the phrenic cells of the opposite side. This smaller part of the impulse is, however, not sufficient, under ordinary circumstances, to cause a contraction of the opposite half of the diaphragm. Only when the crossed impulse is unusually strong or when the irritability of the phrenic cells is increased can the crossed impulse set this side of the diaphragm contracting. The action of one phrenic nerve interrupts the ordinary respiratory part of the same side, and a greater portion, perhaps the whole descending impulse of that side, passes through the crossed dendrites into the phrenic cells of the opposite side. The impulse reaching them is now strong enough to call forth contractions in the half of the diaphragm innervated by them. The established

facts contained in this hypothesis are: The descent of the respiratory impulse in the lateral tracts; the crossing of the impulse at the level of the phrenic nuclei; the ending of the respiratory fibers, like other conducting fibers, in terminal arborizations; and the different course of the dendrites of the motor cells to the cervical region, the majority remaining on the side of the cord where they had origin, the minority crossing in the protoplasmic commissure to the opposite side of the cord.

In the method of observing the effect of rapid changes of external temperature on the discharge of carbonic acid, M. S. Pembrey finds a good means of testing the power of heat regulation in animals, provided that the temperature of the animal, the amount of muscular activity, and the condition of the cutaneous circulation are at the same time taken into account. In newly born animals the power of heat regulation varies according to the development of the animal at birth. Young animals, such as mice, rats, and pigeons, which are born blind, naked, and helpless respond to external changes of temperature in a way somewhat similar to that seen in cold-blooded animals; the variations in the respiratory exchange and the temperature of the animals are in the same direction as the changes of external temperature. These young animals can not regulate their temperature. Young animals, on the other hand, such as guinea pigs and chickens, which are born in a condition of high development and with protective coverings are able even at birth to maintain a constant temperature, provided that the changes in external temperature are not excessive. In the first class of animals the gradual development of the power of heat regulation can be followed. The activity of the animal has to be considered. In adult warm-blooded animals and in newly born animals like the guinea pig and chick a low external temperature increases the activity of the animal. In young animals which only imperfectly regulate their temperature muscular activity is often most marked and maintained at the higher temperatures. The first effect of a fall of temperature is often, it is true, to make the animal active, but its movements soon become feeble, and as regards their purpose are of a similar nature to shivering. The development of the power of heat regulation proceeds simultaneously with the development of the nervous and muscular systems. At the same time the relation of the cutaneous surface to the mass of the young animal and the presence or absence of protective coverings are factors, but only of secondary importance.

It has been found by John Haldane in the course of his inquiries into the origin and action of the suffocative or poisonous gases met with in the air of coal mines that the poisonous action of carbonic oxide diminishes as the oxygen tension increases, and *vice versa*. At a tension of two atmospheres of oxygen this poisonous action is abolished in the case of mice. The disappearance of the poisonous action is due to the fact that at high oxygen tensions the animals can dispense entirely with the oxygen-carrying function of hæmoglobin. The poisonous action of carbonic oxide is entirely due to its

power of combining with the hæmoglobin of the red corpuscles, and so putting them out of action as oxygen carriers.

Circulation.—Contrary to the view that has prevailed since the time of Harvey, J. B. Haycraft holds that the impulse of the heart against the chest wall is diastole, and not systole; and that it is the effect of the force of gravity acting upon the flaccid and passive, but rapidly refilling ventricle from which the pressures of external supporting structures have been removed by the experimenter in his attempts to inspect its action. He contends that in systole all diameters increase, and that when the lungs are inflated so as to give something like their normal support to the heart, it does not twist from left to right, and thus does not strike the chest wall with the apex of the left ventricle.

Experiments on the effect of gravity on the circulation, continued by Leonard Hill, of London, illustrate the quickness with which the pressure alters with even slight changes of bodily position. Turning an animal upon its back, lowering or raising its head, placing it upright, and other changes affect the arterial pressure to a marked degree. Prof. Hill has further shown that an abdominal bandage, by merely restricting the blood supply to the lower viscera, increases beneficially the vascularity of brain and muscles.

By the application of Von Basch's very delicate sphygmomanometer, Van Ziemssen has found that the normal tension in the temporal artery is from 80 to 110 millimetres of mercury. In a case of arterio-sclerosis with cardiac hypertrophy, it rose to from 180 to 210 millimetres, and in a case of valvular insufficiency fell to 50 millimetres, of mercury.

The origin of the blood corpuscles is referred by M. Wernicki to the eosinophile layer of the cancellous tissue of bone, the granules of which receive a coating of hæmoglobin at the spleen, and then constitute the hamatoblasts of Hayem. Dr. Sacharoff is understood to hold a similar view. As against it Siabocillo sets the fact that the rays, the blood of which contains a large proportion of eosinophile cells, have no bones, and therefore no cancellous tissue, Wernicki thinks that all the white corpuscles have the same origin, that they are short-lived, and that they after escaping from the cells by a diapedesis nourish the bones.

The views of Keller, expressed several years ago, as to the constancy of the absolute quantity of blood in the cranial cavity are incidentally supported by the experiments of Bayliss and Hill to determine the relations between the pressure in the cranial cavity and the blood supply to the brain.

Results of much interest have been obtained by W. Halliburton, S. W. Pickering, and T. G. Brodie in experiments on intravenous clotting resulting from intravenous injection of certain artificially made colloid substances. These compounds closely resemble proteids in their chief reactions. Some of them contain phosphorus, while others are destitute of it. It is anticipated that this line of research may cast light on intravenous clotting from disease, and on that induced by the venom of snakes.

The studies of W. Hanssen on the effects of

de fibrinating blood and the act of coagulation upon the blood corpuscles indicate that many of them are destroyed in these processes. The proportion of the uninucleated corpuscles differs from that of the multinucleated.

Dr. Cohnheim reports upon experiments on injecting solutions of sugar into the blood vessels in support of his views as opposed to those of Heldenstein on the formation of lymph. The results were the same as on the injection of salt solutions. The amount of sugar in the blood rose and fell very rapidly, whereas it rose and fell very slowly in the lymph. The maximum of sugar observed in the lymph was equal to the maximum met with at an earlier stage of the experiment in the blood. The solid constituents of the blood became less after the injection, and then increased slowly to the normal; in the lymph, on the other hand, they increased at first and then became less. After the injection of sugar the blood capillaries of a frog's web were considerably dilated, and the circulation quickened. Dr. Cohnheim interpreted these results as indicating an initial passage of water from the intercellular spaces into the blood vessels, followed at a later stage by a return filtration into the lymph. He had also observed a diminution in the secretion of bile after the injection of sugar, and attributed this to compression of the bile capillaries resulting from dilation of the blood capillaries.

A new method of studying the functions of the cell described by Dr. C. Leonard, and applied by him especially to the examination of the movements of the red and white blood corpuscles, consists in making a consecutive series of instantaneous photomicrographs of the same microscopic field, taken at different intervals, so that a comparative study of the series can afterward be made.

By injecting a pigment into a vein, Anderson Stuart has measured the time occupied by, for example, a blood corpuscle in making the circuit of the body, and estimates it, for man, to be fifteen seconds.

Digestion.—Leaving fresh fibrin in strong saline solutions, Dr. A. Daustre found after a certain time 2 globulins in the solution, one coagulating at 54° C. and the other having the properties of serum globulin; proteose and true peptone were also present. This action of saline solutions on fresh fibrin can be divided into different stages. If fresh fibrin be submitted in the same manner to the action of the digestive juices the same results are produced. It is, then, proper to speak of a "saline solution" of fibrin. Fibrin submitted to the action of oxygenated water and to that of micro-organisms gave the same results. When gelatin is similarly treated gelatoses are produced and the gelatin loses its power of contraction.

Speaking of the formation of uric acid in man, Dr. Weintraud said, in the Physiological Society of Berlin, that after the view that the secretion of uric acid is in direct relationship to the proteins of the food had found no support from the experimental side, the theory had been propounded that it related to the breaking down of the leucocytes. This view was supported by experiments in which the administration of nuclein and xanthin to man had in-

creased the output of uric acid; but, on the other hand, similar experiments on dogs had always yielded negative results. The speaker had experimented on several individuals by substituting thyroxine gland, rich in nuclein, for the ordinary flesh of the food. The increased excretion of phosphoric acid in the urine showed that the nuclein was largely resorbed and a constantly large increase in the excretion of uric acid was at the same time observed. The latter disappeared again when ordinary flesh was substituted for the thyroxine gland. Apart from theoretical considerations, it appears that foods rich in nuclein or xanthin should be avoided by patients suffering from excessive formation of uric acid.

Analysis of the bile of 115 children, made by Dr. Sommerfeld, shows that in comparison with the bile of adults it contains more water and mucin and less bile salts. It contains no urea or epithelial sulphates, and in the case of children who had died of diphtheria it was free from bile salts. Examination of the urine of children suffering from various forms of nephritis showed that it contained an abnormally large amount of xanthin compounds which could not be accounted for by any breaking down of epithelial cells or blood corpuscles.

In experiments made by Dr. Vaughn-Buxley to determine the relation of the pancreas to the absorption of fat in dogs, the animals were kept fasting for two days and the bowels were daily washed out with an enema of hot water, a small glycerin enema being given afterward to effect the expulsion of the water. On the third day the pancreas was removed under an anæsthetic, the enemata being continued for two days. These animals were compared with others that were intact. The animals of each set were then supplied with a measured quantity of warm milk, and after a number of hours, that varied in different cases, the animals were killed and the entire contents of the stomach and intestines were separately analyzed. In the intact animals the maximum rate of absorption of fat occurs about seven hours after the ingestion of food, for normally a dog absorbs from 9 to 33 per cent. of the total fat given in from three to four hours, from 21 to 46 per cent. in seven hours, and 56 per cent. in eighteen hours. In a normal dog the passage of fat from the stomach varies with the individual as well as with the time allowed for digestion, but in eighteen hours the whole has entered the intestines. In dogs that have had the pancreas removed, the quantity of fat given is not only again recovered, but a surplus is found which is probably derived from the intestinal secretion or excretion. The author also found that the capacity of passage of fat from the stomach is very much delayed by the extirpation of the pancreas, such dogs passing in several hours only from 9 to 22 per cent. through the pylorus instead of, as in normal dogs, about 56 per cent.

The splitting of the casein molecule that takes place in digestion is found by Drs. E. Salkowsky and Hahn to be due to the specific action of pepsin. It appears that while one part is dissolved and absorbed, the other part remains insoluble as paracasein.

The glycolytic ferment contained in the blood

has been examined by Harburger, who finds that it converts starch into sugar much more slowly but as effectively as the salivary, pancreatic, or intestinal ferments. Its activity, according to J. Abdous and G. Biarmès, differs in different animals and at different ages. Harburger names it glycase, a ferment which has hitherto been found only in plants.

The investigations of Dr. McKechnie, of Talawakela, Ceylon, on the action of tea upon the digestive organs were carried on with test tubes, while a glycerol extract of pepsin was used as the digestive fluid and beef fiber and albumen as the aliment. From the results of the experiments, which are described in detail, the author is led to the opinion that the tannic acid is not the injurious agent in the retarding of digestion by tea, but the injury is caused by some of the less soluble extractive matters; also that the action of tea is not so injurious as some writers think it is. The character of the action depends greatly on the method of infusing. Long-infused teas seem to extract some substance, probably an alkaloid, that has an inhibitory action on the nerves of the stomach.

Glandular System.—A secreting organ is defined by Edward A. Schäfer as one which separates certain materials from the blood and pours them out again, sometimes after effecting changes of some sort upon them, usually upon external surfaces, or at least upon surfaces which are connected with the exterior. There are, however, some secreted materials that are not poured out upon an external surface, but are returned to the blood. These may be termed internal secretions, and they are of no less importance than the ordinary or external secretions. The name of "ductless glands" has been applied to those secreting organs which have been believed to furnish only internal secretions. Such secretions are, however, furnished to a greater or less extent by some of the ordinary glands, and by other parts of the body. Thus the liver and the pancreas are as essential to life by virtue of the internal secretions which they furnish to the blood as by their external secretions, and the entire removal of either cause death, which is due to the removal of the influence they exert upon the metabolism of the body by the loss of their internal secretions. So too does the entire removal of the kidney; although life is sustained if a small portion of kidney substance is left. This is true also of the pancreas, the internal secretion of which has been found to prevent the excessive formation of sugar in the blood and the urine. The functions of the thyroid gland are still undetermined, but facts are cited by Dr. Schäfer which seem to prove that it yields an internal secretion which effects a useful purpose within the body, and that the effects that follow thyroidectomy or removal of the gland—altering the gaseous exchanges so that the animal deprived of it can no longer react to changes of temperature—are probably due to the loss of that secretion. The pituitary body supplies an internal secretion which causes contraction of the heart's arteries. The suprarenal bodies have been the subject of experiments by Dr. Schäfer and Dr. Oliver for two years, the results of which are declared to show conclusively that the medulla

of the suprarenal capsule contains a dialysable organic principle, soluble in water, and not destroyed by boiling for a short time, which produces a powerful physiological action upon the muscular system in general, but especially upon the skeletal muscles, the muscular wall of the blood vessels, and the muscular wall of the heart. A certain amount of action is also manifested upon some of the nerve centers in the bulb, especially the cardio-inhibitory center, and to a small extent upon the respiratory center. These internal secretions, Dr. Schäfer adds, have to be definitely reckoned with by the physician, while at the same time the therapist will be able to avail himself of the active principles which they contain, and in certain cases to use extracts of internally secreting glands in place of the hitherto more commonly employed vegetable medicaments.

Dr. Levy Dorn has communicated to the Physiological Society of Berlin the results of his observations on the effect of various temperatures on the secretion of sweat. His experiments were made upon cats, and dealt with the secretion of sweat at low temperature. The sweat glands were kept at the temperature (19–30° C.) most favorable to the secretion, while the animal's body was cooled by water at 6° C., and secretion was obtained as a result of dyspnoea, notwithstanding the cooling of the body. The author also gave account of experiments made with a view to testing Prof. Grützner's assertion that heat acts only on centripetal and vasomotor nerves, but does not affect motor or centrifugal nerves. Carefully observing all the experimental conditions described by Grützner, he had found that the action of heat on the sciatic nerve leads to a copious secretion of sweat on the cat's paws, that is to say, stimulates centrifugal nerves.

The active principle of the thyroid gland has been further experimented upon by Dr. Sigmund Fränkel, who, precipitating the albuminous bodies from the extract with acetic acid, found that the virtue resided in the filtrate. This was then chemically examined, when upon solution in alcohol and addition of ether an intensely hygroscopic body was obtained, soluble in water and alcohol, the watery solution having a neutral or slightly alkaline reaction. The empirical formula has been calculated as $C_{12}H_{10}N_2O_4$, and the substance is provisionally named "thyreo-antitoxin." Sufficient time had not yet elapsed to establish any definite results from investigations clinically made with this body. Dr. Fränkel has failed to find the fall of blood pressure demonstrated by Dr. Schäfer upon intravenous injection of thyroid extract, but acceleration of the pulse rate was well marked. The author also found that the hearts of frogs poisoned by muscarin which had ceased to beat could again be brought to act by dropping on them a few drops of the thyreo-antitoxin. In animals, too, after the thyroid glands had been extirpated and convulsions and other symptoms had ensued, temporary recovery followed subcutaneous injections of a 1-per-cent. watery solution of the remedy. These experiments agree with those made by Gley, of Paris, with injections of thyroid juice. Dr. Fränkel maintains, therefore, that he has demonstrated

the isolation of the active principle of the thyroid gland, and that it is a pure chemical body with well-defined properties occurring in considerable quantity in the gland. He anticipates that we shall eventually be able to administer this particular antitoxin in exact doses. As he has isolated the body it is odorless, with a taste that reminds us of the extract of beef rather than of the thyroid and its extracts."

The extracts of the ductless glands are shown by the experiments of Oliver and Schäfer to produce, even in the most minute quantities, immediate and incommensurable results. Thus, blood pressure is raised by a trace of pituitary extract, lowered by thyroid, and first raised and then lowered by spleen extract. While extracts of the cortical parts of the suprarenal glands are comparatively inert, extracts of the medullary portion have an extraordinary power when injected into the vessels, raising the arterial blood pressure to from 2 to 5 times the normal tension, apparently by causing contraction of the systemic arterioles.

The studies of M. L. Ranvier on the development of the lymphatic vessels in the embryo of the pig have led to the conclusion that the lymphatic system may be considered as an immense vascular gland, having its embryological origin in the venous system, and throwing its secretory product, the lymph, into the veins.

Muscular System.—The unstriated muscles in vertebrate animals have been found by Dr. Schultz to consist of elongated cells, pointed at each end, the length of which is very variable in different animals. Each cell consists of fibrils imbedded in a highly refractive interfibrillar substance, and of granules and a nucleus in the middle of the cell with two nuclear bodies. Two kinds in one cell were seen only once among thousands of preparations. The fibrils interlace with each other. The separate cells are not held together by any cement substance, but by protoplasmic threads and branches. The transverse striation described by many observers appears to be due to a wrinkling of the cell resulting from complete extension after having been contracted. Nerve fibers are very plentiful. With methylene blue, gold chloride, or by Golgi's method, numerous ganglion cells can be brought into view, from which short branches are distributed to the muscle cells. In addition to these, numerous nerve fibrils can be seen ending in minute bulbous swellings which are applied to the muscle. The nerves are sensory as well as motor.

The conclusions reached by Mosso and Harley as to the respective functions of active and resting living muscle are confirmed by the experiments of Prof. Stokvis. This author reiterates the conviction that resting living muscle must be looked upon as a storehouse of potential energy, while active muscle represents a close approach to absolute perfection in the conversion of the energy of the fuel or food into work; and considers himself justified in assuming that in healthy persons muscular fatigue and exhaustion are not caused by want of food but by want of rest.

Prof. Gaule, of Zurich, regards the growth of muscle as periodic, and supposes that changes corresponding to the periods exist in muscular fibers. He has found that within twenty-four

hours of the existence of the inferior cervical ganglion the weight and power of the same side increase in blood and show a greatly diminished resistance to mechanical strain.

An Italian physician, Signor Manca, has investigated the influence of fasting for periods of twenty-four and of thirty-six hours on his muscular power, testing this both by voluntary efforts of, and by the application of an electrical current to the muscles of his forearm. The conclusion at which he has arrived is that fasting within the above limits has no influence on the muscular power. The deviations after longer periods observed by other investigators, he thinks, are attributable to the effects of the fasting on the nervous system, circulation, and respiration. Signor Manca distinguishes two stages in fasting: one in which a kind of compensation of the injurious effects of fasting is effected through the agency of the nervous system, and a second in which there is deranged compensation, with disturbances of the several organs strongly marked, accompanied by loss of weight and abundant excretion of nitrogen in the urine, after which death occurs. The great powers of resistance possessed by the muscles in regard to their force are, he thinks, due to the glycogen and sugar in the blood, which do not materially alter in quantity even after prolonged abstinence.

In experiments by Prof. Zuntz and Dr. Schomburg on the effect of load on the metabolism and body functions of soldiers on the march, two students, feeding uniformly on a somewhat complicated but accurately analyzed diet, made on alternate days marches up to 45 kilometres with a load increasing to 51 kilograms. Taking first the nitrogenous metabolism, it was found that the excretion of nitrogen through the urine and sweat was but slightly increased by even the most severe exertion. The slight loss of glycogen thus noticed was made good in the subsequent period of rest. At the end of each experiment the consumption of oxygen was found to be greater than at the beginning. When the marches were made on three consecutive days with an increasing load, it was found that the consumption of oxygen was increased even at the beginning of the third day's march, and was still further increased at its end. The body temperature rose to 38.5° C., and in some cases to 40° C. The best production was three times as great as during rest, and the regulation of temperature to compensate for this was almost entirely brought about by the evaporation of sweat. The concentration of the blood was found to be but very slightly increased by exhausting marches; the blood-red corpuscles were hardly more numerous than normally, whereas the white corpuscles were increased to a marked degree in number. The movements of the heart at the end of the experiments showed a lengthening of the systole and dilatation of the right ventricle, whose dull area on percussion, as also that of the liver, was extended during severe exertion. The respiratory severity was at first, and with light loads, improved, but later on difficulties in breathing made their appearance. The psychic condition, as measured by the reaction time to simple stimuli, was not depressed by heavy marches; but when fatigued patients reacted more slowly to complicated stimuli. Muscles not used in marching were as

readily excitable at the end of the most severe march as during complete rest. A high external temperature was found to exert the same influence with a light load as the heaviest load did at more moderate temperatures, and some details of the experiments were found to depend on individual proclivities.

Nervous System.—Prof. Waldeyer, in an account of the most recent researches on the formative structures of the nervous system, lays special stress on the following statements: The entire nervous system consists of single elements, which may most conveniently be called *neurons*, each of which is composed of a nerve cell and its processes. These processes are, on the one hand, protoplasmic *dendrites*, which rapidly become branched, and, on the other hand, *neurites* or *axons*, which give off collateral branches, soon become medullated, and end in fine branchings, as also do the collaterals. Each nerve cell has only one axon. The dendrites convey impulses to the cell; the neurites or axons convey impulses from the cell. All nerve fibers, both dendrites and neurites, end freely in fine branchings. Every physiological path of conduction, whether from the periphery to the central nervous system or *vice versa*, consists of two or more neurons; never of one. Conduction in the neurons is always longitudinal. Impulses are transmitted from one neuron to the other only by means of the free endings of the terminal branches.

From experiments in which section of all the sensory roots of the nerves distributed to a limb was followed by permanent motor paralysis, in addition to the anesthesia which might be expected to occur, Dr. Mott and Prof. Sherrington conclude that the whole sensory path from periphery to cortex cerebri is in action during voluntary movement. Dr. Bastian, on the other hand, maintains that there are no motor, but only sensory centers in the cortex cerebri, sensory impressions and the activity of sensory centers being the real guides for volitional action, and the true motor centers existing only in the spinal cord. Dr. E. Steinbach has shown that the posterior roots of the spinal nerves are not exclusively sensory, but also contain motor fibers, which are distributed to the visceral muscles originally developed from the lateral plates in the embryo.

Mosso has set forth that the brain is a seat of active combustion, and that its temperature rises still higher when it is stimulated to activity by direct excitation or by drugs. The experiments of Leonard Hill and N. D. Nabarro do not bear out these conclusions, for it appears from them that when compared with the muscles the brain is not a seat of active combustion, and it seems very improbable to them that its temperature should be perceptibly greater than that of the blood.

It results from the experiments of Grigorescu that the rapidity of transmission of sensory impressions and of motor impulses is the same in the sciatic nerve and spinal cord. The absolute rapidity of sensory impressions in the sciatic nerve and cord together is from about 25 to about 31 metres per second. In the cord alone it is upward of 51 metres per second, so that time is lost in the transference of the sensory

impression from the terminals of the sciatic nerve in the cord to the cells of the cord. In locomotor ataxy the speed is slower in both, but especially in the cord.

Much information concerning the conditions of sympathetic or referred pain has been afforded by the combined results of the experiments of Sherrington and the more clinical researches of Head relative to the precise nervous connections between the sensory nerves from the internal organs of the thorax and abdomen and certain other sensory nerves supplying the skin. Examples of pains on which light is thus thrown are that over the chest when the blood vessels of the heart are occluded in angina pectoris, pain between the shoulder blades in liver diseases, the radiating pains attending the passage of calculi along certain ducts, and the headaches and neuralgias connected with various kinds of visceral irritation. In these researches, with those of Langley and Anderson, certain areas of the skin surface have been defined as invariably the seat of referred pain when certain deep organs are diseased.

In his application of the results obtained by Gaskell's observations on somatic and splanchnic nerves to the study of the emotions, Prof. A. C. Wright takes as an example the phenomena observed in a kitten confronted with a strange dog, and shows that such an emotional stimulus would call forth in the kitten a regular series of reflex responses. First, through the involuntary visceral nerves; then the semi-involuntary muscles would be called into action; and, lastly, a reflex response would take place in certain parts of the voluntary muscular system. The essential features to be recognized here and in every emotional reaction are the origination of the emotion in a violent sensory stimulus, a condition of extreme neural tension in the reflex center, and an overflow of neural energy into different paths. This overflow takes place first into channels associated with semivoluntary muscle, and lastly into those associated with voluntary muscle. The physiological essence of the emotion is to be found not in the visceral reflex actions, but in the high neural tension of the reflex center which gives rise to those actions. In childhood sensory stimuli call forth in each case responses of both involuntary and voluntary muscle, while with increasing age the outflow of neural energy from the reflex center becomes more and more restricted to paths associated with involuntary muscle. As a result of such transformation we get voluntary action with a purpose. Some system of control of the reflexes appears to be *a priori* a necessity, since, "if each animal stimulus were to evoke a separate reflex movement in an organization which was endowed with sensitiveness at all approaching that of the human organization, life would be a mere chaos of involuntary movement." Voluntary muscles react to the slightest stimuli, but involuntary muscular actions are called out only by intense stimuli or by a summation of slighter ones. High neural tension in the reflex center is therefore necessary for these reactions of involuntary muscles, and all such high neural tension is attended with symptoms of distress. The replacing of the "generalized somatico-visceral re-

fluxes of inexperience and childhood by the specialized purposive reflexes of experience and adult life . . . is not so much a question of substituting one variety of reflex for another as it is a question of substituting a condition of low neural tension for a condition of high neural tension."

An investigation by C. F. Hodge of the changes in ganglion cells from birth to senile death leads him to the conclusion that if we take the nucleus to be the source of rejuvenation for the cell protoplasm, age seems to be indicated as of the nature of final fatigue—final because the source of energy for the nerve cell has dried up at the fountain head. It is not implied that nerve tissue is of any more importance in relation to physiological dying than any other tissue. The exact position held by each must be clearly determined by experiments.

Having studied the rapidity with which the tetanuses producing voluntary tetanus succeed each other, Dr. Fraser Harris finds that the contraction of the muscle is not a complete but an incomplete tetanus, and that the rhythm of the volitional impulses proceeding from cerebral motor areas has an average rate of from 10 to 12 per second, or that it has some higher rate transmitted into one of 10 or 12 per second by the activity of the motor cells of the cornua of the spinal cord.

Two years after Prof. Vitzou, of Bucharest, had produced blindness in a monkey by removal of the occipital region of the brain, the animal recovered a small part of its vision. A new formation, very vascular, was found on examining the brain at the seat of the lesion. Its excision reproduced the blindness. Nervous elements were found in this new tissue.

The Mexican cactus called peyotl has an intoxicating action, and in large doses produces sleep and a state of nervous excitation accompanied by a disposition to voluble speech. Small doses of the alkaloid given to frogs by Prof. L. Lewin produced tetanic cramps and a greatly increased reflex irritability, analogous to the effects of strychnine; but with the difference that by carefully apportioning the dose the effects were permanent for several days. Similar results were obtained on administering the new alkaloid to rabbits, and Prof. Lewin regards it as specially adapted to further the study of the nature of tetanus. It was noticed in rabbits that during each paroxysm of cramps the blood vessels of the ears were widely distended. The author has found alkaloids with powerful actions in many other species of cactus hitherto regarded by botanists as harmless.

Dr. M. Grossman has demonstrated that the inhibitory fibers of the heart are formed by the 3 or 4 lower fasciculi of the vagus and the uppermost fasciculus of the spinal accessory nerve.

Special Senses.—The results of the investigations of Exner in cerebral localization are summarized by Dr. E. C. Spitzka, of New York, as having shown that the general principles of localization are correct, while they have made the narrow limitation of numerous centers to areas not exceeding a few millimetres in diameter seem untenable. "Just as the fiber masses of the corona radiata are seen to spread out fan-shaped, and while terminating chiefly in some

special cortical districts, yet detach scattered fibers to neighboring areas, so the fields of cortical function delineated by Exner in his great work are shown to consist of 'absolute' and 'relative' fields. The former have a constant relation to a given function; the destruction of the 'absolute' field for the muscles of the arm is always followed by paralysis of these muscles. The latter have an inconsistent relation; the destruction of the 'relative' field of the arm muscles, which surround the absolute field in zones of gradually diminishing intensity, sometimes leads to such paralysis and sometimes does not. The various fields of motor and sensory function are also noticed to develop considerably; the field for the arm dies out within the visual area and encroaches considerably on the speech field. But a most interesting part of Exner's laborious compilation and comparison of the numerous cases of limited cortical lesion scattered through modern neurological literature is his conclusion that, as a rule, the sensory fields are nearly identical with the motor fields for the same periphery, and he cites this as a remarkable confirmation of the experimental results of Munk, who found his tactile areas in the dog's brain to correspond with the motor areas of Hering and Fritsch. Not only do the tactile fields correspond very closely to the motor fields of the same body regions, thus sustaining the anticipation of Meynert that the function of the cortex is not so much the liberation of an explosive motor force as the mediation of sensations of innervation, but all determinable function areas which on physiological grounds must be considered to require a bond of association in the cerebral mechanism are found to have a regional contact. Thus, the symbolic field, that is devoted to the registration and liberation of spoken and written symbols, is found to approach the fields of the upper extremity and of the lingual and auditory peripheries. While our knowledge of the sensory cortical area is daily becoming more satisfactory, that of the course of the sensory tracts connected with the cortical areas in question is very imperfect.

The mechanism of accommodation in the eye, which has not yet been satisfactorily determined, is discussed again by Dr. Wilhelm Scherer. The physiological problem as propounded by Aubert is, How can the increase in the convexity of the anterior curvature of the lens in accommodation of the eye for near objects take place without change of curvature of the posterior surface of the lens and without change of place of the lens itself? Dr. Scherer thinks the question to be solved would be better put in the form, How can the increased curvature of the anterior lens surface occur without change of place, without material alteration in the posterior surface of the lens, without forward movement of the whole lens, and without increase of tension in the anterior chamber? After criticizing the generally accepted theory of Helmholtz to the effect that accommodation for near objects is effected by the contraction of the meridional fibers of the ciliary muscle, which relaxes the zonular fibers, and thus permits the lens to become more convex, and those other theories which attribute accommodation to the action of the circular fibers of the ciliary muscle, to blood pressure exerted on the lens through

the iris or the ciliary processes, to increased tension of the zonular fibers, and to change in the hydrostatic pressure in the anterior chamber, Dr. Schoen advances his own theory, which he thinks can best be understood from the following illustration: An elastic ball is to be grasped with both hands, the wrists being kept together. The 10 fingers are then bent in so as to be applied to the ball along a line that, if the ball represented the earth, would correspond to the arctic circle. If pressure be now made with the tips of the fingers the free part of the ball will bulge forward. Now the finger tips represent the ciliary processes and circular fibers of the ciliary muscle, the palms of the hands the meridional fibers of the ciliary muscle, and the two wrists the optic nerve. The anatomical relations, he contends, correspond completely to his theory for the anterior capsule. The zonular fibers and the retina form an investment to the vitreous humor and to the lens that are quite analogous to the elastic ball. The fibers of the ciliary muscle and choroid lie on the outside of the investment just as the palms of the hand are external to the elastic ball, and the ciliary processes form a similar groove, and exert the same kind of pressure as the tips of the fingers in the above illustration. The depression caused by the ciliary process is always slight, never exceeding 1 millimetre.

The invisibility of infra-red light is explained by Cima and Jansen on the ground that the humors of the eye are opaque to it; by Tyndall, Engelmann, and others, because the light is incapable of exciting the retina; while Helmholtz supposed that the strong absorption suffered by the infra-red rays in their passage through the eye was sufficient to account for it. While all observers have found that the rays are strongly absorbed in the eye, Herr Aschkinass has recently shown, as the result of experiments made upon thin layers of the humors of an ox eye and a human eye, that there is no sudden increase of absorption beyond the red end of the spectrum, and that the absorptive powers of the various media of the eye are practically the same as those of water; and the experiments indicate that a large proportion of infra-red light reaches the retina through the eye, but is not capable of affecting the nerves and producing sight.

Miscellaneous.—M. Charles Richet, in a paper on "Functions of Defense in Man and Animals," deals, among other things, with the power warm-blooded animals have of resisting exposure to cold. In the dog exposure to a cold of -91° C. for half an hour was accompanied by a rise in the rectal temperature, and it resisted the effects of that degree of cold for two hours. Shivering on exposure to cold may be contrasted, the author remarks, with the beneficial effects of sweating on exposure to heat. He points out the advantages of the sentiment of fear which is inspired by so many animals and circumstances, and which saves us often from ourselves. The same may be said of the feeling of vertigo. M. Richet maintains that were it not for the sensation of vertigo falls and serious accidents would be of much more frequent occurrence. Pain, too, or the anticipation of it, has its protective influence. Under pain the respiration quickens, the heart beats more rapidly,

the arterial blood pressure rises, the glands secrete more abundantly—all conditions that tend to the re-enforcement of the biological activity of the organism. As Brown-Séquard would have said, there is dynamogeny of the whole body. Finally, he considers the remarkable means of defense we possess in our leucocytes and phagocytes against the multiplication of microbes in our system.

It is remarked that more varied physical agencies and more multifarious and complicated chemical phenomena are found among cold-blooded than among warm-blooded animals. Some fishes and many insects and marine animalcules have the power of emitting light; several fishes, a bug, and a slug, it is said, have command of the electric current; many arthropods and a few mollusks have the power of secreting and emitting silk; many reptiles, amphibia, fishes, insects, and arachnoids secrete intense poisons, which are very rare among the higher animals, except under diseased conditions; dyes, also rare among mammals and birds, are abundant in mollusks and insects; and odors are much more abundant among cold-blooded forms than among the higher animals. In view of these facts the question is suggested by Mr. J. W. Slater as a subject toward which research may be directed whether the energy which in hot-blooded animals is expended in keeping up the temperature of the body may not in the cold-blooded forms be converted into luminous or electrical or chemical energy?

Among a number of instances of death by electricity studied by Mr. Bernhardt was one recorded by Dr. J. Kratter of a man who was traversed by a current of high tension, and was found breathing stertorously a few steps from the point where he made contact. The *post-mortem* examination, twenty-one hours after his death, disclosed 2 small wounds, one on the index finger, and the other on the back, with large extravasations of blood in their vicinity. All the organs of the body showed hypervenous blood, acute oedema of the lungs was present, extravasations were observed in various places, the muscles were in extreme rigor, and the heart was partially relaxed. No microscopic changes were remarked. Dr. Kratter thought that the electric shock suddenly paralyzed the heart, and that was the immediate cause of death, accompanied by oedema of the lungs producing hypervenosity of the blood. A marked contusion was seen on the left side of the diaphragm at the point of contact of the heart. Experiments made on animals showed that in them the respiration was usually primarily arrested, causing asphyxia and secondary stoppage of the heart's action, though the heart is sometimes first affected. In a second case, reported by M. d'Arsonval, the current, of 4,500 volts, entered at the head of the man, and issued at his back. On the application of artificial respiration by Sylvester's method, more than half an hour afterward, recovery took place. In a third case, reported by Dr. Donellan, on the passage of a current of 1,000 volts through a man, coma instantly resulted, with dilated pupils, pallor of the face, and sweating; delirium and tonic, alternating with clonic spasms, followed. The pulse was 80, the respiration, at first stertorous,

passed into the Cheyne-Stokes type. After the injection first of morphine, then of strychnine, the patient fell into a deep sleep, from which he awoke convalescent.

Experiments by Dr. Renzl showed that sunshine materially assisted guinea-pigs in contending with tuberculous disease; for the animals thus affected succumbed much more rapidly in more diffused light than those which were exposed in glass boxes directly to the sun's rays. Dr. Masella has found, on the other hand, that animals infected with typhoid and cholera germs died more rapidly, when they had been previously exposed to sunshine, as did also those that were exposed after inoculation, and under smaller doses, than those kept in diffused light. The difference was proved to be not due to the temperature of the medium, for the fatal effect was the same in sunshine boxes cooled by a current of water flowing through them.

Experiments by Dr. Max Müller on the effect of fever temperature upon the growth and virulence of the typhoid bacillus show that when preserved at about 40° C. this microbe takes five minutes longer to produce a new generation than when it is kept at a temperature of from 37.5° to 38° C.—that is, that in the absence of adverse circumstances, as many as 45 generations of typhoid bacilli may proceed in one day from a single parent bacillus at the normal temperature of the body, while at about 40° C. 29 such generations may be produced. A fever temperature of 40° C. is not, therefore, able to destroy the typhoid bacillus, or to affect its growth to any considerable extent. Even higher temperatures of from 41.5° to 42° C. were incapable of destroying the microbe, and typhoid bacilli kept for sixty-two days at 42° C. showed no abatement of their vitality afterward. No difference was observed in the virulence of the bacillus within the range of temperature of the experiments.

In a paper by Dr. John Haldane on the physiological effect of black damp as found in two English collieries, that substance, also called choke damp, or stythe, is distinguished from fire damp by not being explosive, while it extinguishes flame; from after damp, by its not being the product of an explosion, but as collecting in the workings under ordinary conditions; and also from white damp, which is capable of supporting combustion, while it acts as a poison when inhaled. It is found to consist, when undiluted, of nitrogen containing an admixture of from a seventh to an eighth of a volume of carbonic acid. Air containing just sufficient black damp to extinguish a candle or oil lamp produced no immediately sensible action on a man. A mixture of about 16 per cent. of the black damp and 40 per cent. of air would be required to produce immediate danger to life. The dangerous physiological action of the black damp, the author concludes, is due to deficiency of oxygen, not to excess of carbonic acid. The effect, first appreciable when increasing proportions of black damp are breathed, is, however, due to carbonic acid alone.

The capacity of the roots of plants to penetrate into living tissues has been investigated by Mr. George Peirce, who first studied the amount of pressure required to force an iron rod into the

tissue. He then planted rape seed and white mustard seed within a split potato, leaving the parts of the potato together again. After a suitable interval it was found that nearly all the seeds had germinated, and some of the plants had pushed their rootlets down, so as to penetrate the substance of the potato. In some instances the growth had been so vigorous that the rootlet had traversed the whole thickness of the parenchyma, pierced the hard corky layer of the surface, and reached the damp medium in which the whole was packed. Anatomical examination of the root and surrounding potato tissue showed several peculiarities. The young shoot was almost devoid of the usual coating of hairs; the cells of the potato had undergone alteration, those in immediate contact with the advancing root being much distorted and torn, while 2 or 3 layers adjacent to the injured elements had undergone division by walls parallel to the long axis of the root, and had subsequently become corky. By this means the intrusive rootlet was enclosed within a corky cylinder or sheath, cutting it off more or less perfectly from the living, unharmed tissue of the tuber. So far the experiments proved that the thin, delicate, and pointed roots of rape and white mustard are able to penetrate living tissues. Mr. Peirce carried the matter further by testing the power of the blunt rootlets of the pea and vetch, and found that they, too, could pierce the living tissue. Other experiments were made on the same plants, with other plant tissues substituted for that of the potato. The results were the same, except that the tissue of rhubarb appeared to be unsuited to the young plant. Mr. Peirce further succeeded in growing specimens of pea as parasites upon other plants, from the seedling state to flowering. The young pea grown under such uncultivated conditions produced an almost normal root system, with numerous side branches, but the stem was stunted, although it bore leaves and a few flowers.

POLISH NATIONAL ALLIANCE, an organization of Polish citizens in the United States, founded in 1880, with 3 branches, 1 each in New York, Philadelphia, and Chicago. In 1905 it included 250 individual societies, or groups, with a membership of over 10,000. One of the main objects of the Alliance is "to develop, morally and materially, the Polish element in the United States by establishing proper institutions, as Polish schools, libraries, immigration stations, and in general all institutions of benevolence and Polish industries." It is provided that every member joining the Alliance shall endeavor to obtain naturalization papers with the view of becoming a citizen of the United States, and no member is allowed to belong to any anarchistic, socialistic, or socialist society. The Alliance publishes an official newspaper in Chicago, where it also has a museum and library. Among its treasures are many precious relics pertaining to the history, art, and literature of Poland, and also valuable documents relating to the history and the literature of the United States. A monument to the memory of the Polish hero Thaddeus Kosciuszko will be erected in Chicago by the Alliance. While merely a secular order, the Alliance, through its individual members, has given much support to the holy

formed Independent Roman Catholic Church, which see on page 357.

PORTUGAL, a constitutional monarchy in southwestern Europe. The throne is hereditary in the family of Saxe-Coburg-Braganza. The legislative power is vested in the Cortes, consisting of a Chamber of Peers and a Chamber of Deputies. There are 52 hereditary peers remaining. Of the others, 13 are spiritual peers, 50 were elected by delegates of districts and learned bodies, and 139 have been appointed by the crown. The Deputies are elected for four years, 163 by continental districts, the Azores, and Madeira, and 12 by the colonies. The size of both houses and the conditions of representation have been changed for the future.

The reigning king is Carlos I, born Sept. 28, 1863. The ministry at the beginning of 1895 contained the following members: President of the Council and Minister of Finance, E. R. Hintze Ribeiro; Minister of Foreign Affairs, Carlos Lobo d'Avila; Minister of the Interior, F. F. Pinto Castello Branco; Minister of Justice and Worship, A. d'Azevedo Castello Branco; Minister of War, Col. L. A. Pimentel Pinto; Minister of Marine and the Colonies, J. A. de Brissac dos Neves Ferreira; Minister of Public Works, Commerce, and Industry, Campos Henriques. On Jan. 16 the Minister of Marine resigned, and Capt. Ferreira Almeida was appointed his successor. He in turn resigned on Nov. 25, owing to differences respecting naval reforms, and was succeeded by Jacintho Candido. L. De Soveral succeeded the late Lobo d'Avila as Minister of Foreign Affairs on Sept. 20.

The Army and Navy.—Portugal has a standing army of 30,000 men raised by conscription. The year's contingent was 19,917 men for 1895. The soldiers serve uninterruptedly through the first year, and have four months' leave in the second and eight months' in the third year. About 2,000 men besides are furloughed. The war effective is about 100,000 men.

The navy consists of 1 ironclad corvette of 2,422 tons, 6 corvettes, 14 gunboats, 5 monitors, 10 sloop gunboats, 2 armed transports, and 4 torpedo boats.

Commerce.—The value of merchandise imports in 1894 was 35,662,499 milreis, and of exports 23,911,793 milreis. The imports of precious metals were 826,030, and the exports 3,883,933 milreis. The principal imports are cereals, cotton, sugar, fish, coal, cotton cloths, iron, wool, animals, hides and leather, silks, machinery, coffee, staves, rice, chemicals, petroleum, spirits, and tobacco. The values of the leading exports were: Wine, 9,742,000 milreis; cork, 2,955,000 milreis; copper, 2,238 milreis; animals, 1,902,000 milreis; fruits, 937,000 milreis; sardines, 760,000 milreis; cotton goods, 669,000 milreis; onions, 277,000 milreis.

There were 5,556 sailing vessels, of 488,000 tons, and 5,118 steamers, of 6,720,000 tons, entered at all the ports in 1894. The merchant marine consist of 67 steamers and 486 sailing vessels.

Political Events.—The system of parliamentary government was virtually suspended in 1894. The Chamber that was elected was not called together and financial and other legislation was enacted by royal decrees. A series of

decrees were issued on Jan. 13, 1895, concerning taxation, emigration, the army, and other matters. One imposed capital punishment on offenders convicted of political offenses or rebellion. Another required all persons, natives or foreigners, who leave Portugal by land to take out passports. On March 31 a decree was published dissolving the Chamber and transforming the electoral system. The number of Deputies was reduced to 120, of whom 114 represented the kingdom and 6 the colonies. Naturalized foreigners were made ineligible, also managers and directors of companies having concessions from the state, and many classes of public functionaries. The Deputies will receive salaries. The legal and medical professions must not have more than 20 representatives. The new law does away with the representation of minorities and introduces the system of *scrutin de liste*. On Sept. 26 a decree was issued effecting changes in the Chamber of Peers, which will henceforth consist of 90 life members, in addition to the bishops, the princes of the blood royal, and the hereditary members whose peerages are not yet extinct. The nominated peers may be selected without distinction of class, though certain disqualifications are imposed. The elective portion of the Chamber of Peers ceases to exist.

By a decree issued on March 24 the Azores receive autonomous institutions. This concession crowns a series of measures for the better administration of these islands.

During a national feast held in June in celebration of the seven-hundredth birthday of St. Anthony of Padua, who was a native of Lisbon, anarchistic manifestoes were circulated and popular demonstrations against the clergy, and especially against the Jesuits, took place. The citizens of Lisbon and other towns, except the Clericals, regarded the festivities with cool indifference. The democratic papers clamored for the enforcement of the law prohibiting the continuance of religious confraternities. The Government issued a circular to the bishops declaring that it would punish severely all attacks upon priests and the Catholic religion, but it would not allow Catholics to make use of religion for political objects. King Carlos, who had visited England, arranged to pay a visit in October to his uncle, the King of Italy, but the trip was abandoned when the papal secretary informed the Portuguese Government that the Pope would consider such a visit a personal affront. The Italian Government, when informed that the engagement had been canceled for this reason, replied by expressing a hope that Portugal would recover her independence of action. A treaty of commerce between Portugal and Russia was signed at Lisbon on July 9.

The parliamentary elections took place on Nov. 17. The Republicans and Progressists in many districts abstained from voting against the Government candidates, and the people generally showed the utmost indifference.

Colonies.—The colonial possessions of Portugal in Africa comprise the Cape Verde Islands, with an area of 1,650 square miles and 110,926 inhabitants; Portuguese Guinea, with an area of 14,000 square miles and 800,000 inhabitants; Princes island and St. Thomas, with an area of 454 square miles and 21,040 inhabitants; Angola,

with Ambriz, Benguela, Mossamedes, and the Portuguese Congo, with an area of 457,500 square miles and 19,400,000 inhabitants; and Portuguese East Africa, with an area of 261,700 square miles and 1,500,000 inhabitants. In Asia Goa has an area of 1,447 square miles and 514,169 inhabitants; Damão and Diu have an area of 158 square miles and 77,454 inhabitants; Macao has a square miles of area, with 67,096 inhabitants; and Timor and Kambing have an area of 6,290 square miles, with 800,000 inhabitants.

The aggregate revenue of all the Portuguese colonies in 1895 was 4,926,314 milreis; the expenditure was 5,162,862 milreis. Their total imports in 1891 amounted to 3,939,000 milreis, and their exports to 5,121,000 milreis. There are 161 miles of railroad in Angola and 199 miles more are building; in East Africa 58 miles are completed and 427 miles are projected; in India there are 50 miles in operation.

The troops regularly maintained in the transmarine possessions are 1 regiment of colonial infantry, exclusively made up of Europeans, consisting of 50 officers and 1,143 men, and 8 battalions of African rifles and 2 companies in Timor, numbering 488 officers and 7,797 men. In consequence of the insurrection of natives at Laurence Marques its garrison was increased by 24 officers and 603 men (see CAPE COLONY AND SOUTH AFRICA). Subsequently fresh re-enforcements were sent in order to pursue an active campaign against Gungunhama.

Following upon the disturbances in South Africa there was in September, 1895, an outbreak in the Portuguese portion of the island of Timor. Troops that marched against the rebels were defeated, and the Secretary and 3 agents of the Government were killed. The Governor set out with fresh troops and eventually quelled the insurrection. In the same month a mutiny occurred among troops about to embark for East Africa, because the Administrator, Gomez de Costa, would not guarantee their pay. The force, 500 in number, marched off with their arms and ammunition. The revolt spread, and troops were sent from Portugal to suppress it. The English Government offered to lend troops in put down the rebellion, as it had offered before in the case of the insurrection at Delagoa Bay, and the Portuguese Government again declined assistance. All men between the ages of sixteen and forty-five were summoned to the defense of the capital on pain of being treated as rebels if they did not report for duty. An expedition was sent from Portugal to bring the rebels to terms.

In East Africa the Portuguese column commanded by Col. Galhardo attacked Gungunhama's army on Nov. 5, and routed the natives with great slaughter. On Nov. 11 the Portuguese forces captured and destroyed Gungunhama's kraal.

PRESBYTERIANS. I. Presbyterian Church in the United States of America.—The statistical tables of this Church presented to the General Assembly in May give the following footings: Number of synods, 31; of presbyteries, 224; of ministers, 6,797; of candidates, 1,477; of local evangelists, 215; of licentiates, 474; of churches, 7,496; of churches organized during the year, 176; of communicants,

922,904; of members added during the year on examination, 67,908; of baptisms, 23,726 of adults and 27,731 of infants; of members of Sunday schools, 994,703; amount of contributions for home missions, \$997,569; for foreign missions, \$713,997; for education, \$214,637; for Sunday-school work, \$131,689; for church erection, \$217,824; for the Relief fund, \$92,332; for the freedmen, \$111,449; for freedmen and, \$72,265; for aid for colleges, \$145,964; for the General Assembly, etc., \$69,329; congregational contributions, \$9,921,141; miscellaneous, \$487,980; total contributions, \$13,647,578. The number of communicants is 6,917 greater, and the total amount of contributions \$364,548 less than in 1894. Record is made in the tables of 313 discourses, 273 ordinations, and 302 installations of ministers during the year, and the number of elders is given as 56,069 and of deacons as 9,058.

The receipts of the Board of Home Missions, \$934,260, were larger than those of any previous year except 1893, when a large legacy was received. Yet the debt of the board had never been larger than now. Seventeen hundred and thirty-one laborers had been employed. The schools in the Alaskan, Indian, Mexican, Mormon, and mountain departments numbered 114, with 391 teachers and 9,466 pupils.

The Board of Education reported that a larger number of recommendations had been received during the year than in any previous year in its history. The whole number of students accepted and enrolled had been 1,935, of whom 316 were new men. The income from churches and Sunday schools—about \$50,000—had been nearly \$2,000 greater than in the year before. The permanent fund yielded about \$4,000.

The Board of Church Erection had received 225 applications, 11 more than in the previous year, but as fewer large sums had been asked for, the aggregate demand—\$129,832—was smaller. The entire receipts had been \$295,569, and the expenditures \$124,184. There had been reported to the board during the year as completed through its aid without debt 163 churches and manse, the total value of which was nearly \$500,000.

The Board of Relief had had under its care 785 cases of ministers, widows of ministers, orphan families of ministers, women missionaries, etc., and 23 persons had been provided for at the Ministers' Home at Perth Amboy, N. J. The income for the year had been \$173,824, and the expenditure \$174,140. The estimated value of boxes of supplies sent to families in the field by various churches and societies was \$4,183. The permanent fund aggregated \$1,321,094.

The Board of Missions to Freedmen had received \$173,000, or \$3,279 more than in the previous year, and had expended \$162,764. The debt had been reduced to \$23,251. There were returned as visible results of its work 175 missionaries, 9 white and 166 colored; 235 teachers; 206 churches, with 17,083 communicants; 106 Sabbath schools, with 19,784 pupils; other schools, 87, with 10,329 pupils.

The Board of Publication and Sabbath Schools had kept in the field 82 permanent missionaries and 12 auxiliaries laboring in the summer, through whose agency and the stimulus of its

grants 1,446 schools had been organized or re-organized, into which 5,455 teachers and 44,004 pupils had been gathered and from which 50 churches had already grown. The year's profits of the business department amounted to \$36,800. The editorial department had issued 22 books and tracts. The Sabbath-school department returned 7,283 Sabbath schools, with 977,822 officers, teachers, and pupils.

The Committee on Systematic Benevolence, for the first time since its organization, in 1879, reported a decrease in gifts to benevolent objects, the amount of decrease as compared with the previous year being \$44,829. The Boards of Home Missions, Foreign Missions, Sabbath-school Work, and Aid for Colleges and Academies reported gains aggregating \$123,650; while those of Education, Church Erection, Ministerial Relief, and Freedmen returned losses of \$168,479.

The Board of Foreign Missions had received \$865,709, while its expenditures had been \$976,885, as against \$995,922 in the preceding year. Forty-three new missionaries had been sent out. From the mission fields in Africa, China, Guatemala, India, Japan, Korea, Mexico, Persia, Siam, South America, Syria, and among the Chinese and Japanese in the United States were returned 116 principal stations and 583 out stations; 659 American missionaries (including ordained and medical missionaries, lay teachers, and others), 1,943 native missionaries, teachers, and helpers; 391 churches with 32,104 communicants (3,772 having been added during the year); 109 students for the ministry; 30,452 pupils in schools, boarding and day and for boys and for girls; native contributions of \$65,828; and 33 hospitals and dispensaries, at which 256,514 patients were treated during the year.

The receipts of the Woman's Executive Committee of Home Missions for the year had been \$267,333, and the disbursements \$363,515. The debt at the beginning of the year was \$10,000. The report of the superintendent of schools described the work done—in Alaska, 8 schools and 37 teachers; among the Indians, 24 schools and 140 teachers, reaching 31 tribes; among the Mexican population of the border region, 27 schools and 53 teachers; among the Mormons, 30 schools and 84 teachers; and among the mountain people of the South, 25 schools and 77 teachers. In these 114 schools, with 391 teachers, were enrolled 1,640 pupils as boarders, while 7,828 pupils were attending the day schools and 6,377 pupils the Sunday schools connected with the day schools.

The one hundred and seventh General Assembly of this Church met in Pittsburg, Pa., May 16. The Rev. Dr. Robert Russell Booth, of New York, was chosen moderator. The committee appointed by the previous General Assembly to confer with the theological seminaries reported concerning its conferences with the boards of the Princeton, McCormick, Auburn, Western, Lane, Danville, San Francisco Seminaries, and Lincoln University. It explained to each of these boards that the clauses in its recommendations to them in the matter of putting themselves more immediately under the control of the General Assembly which covered those several points were not intended to change the

title, ownership, or disposition of the property held by the various institutions or to confer any right of control or interference upon the General Assembly, but only to make sure that the property was held for no other purpose than theological education according to the standards of the Presbyterian Church; that the powers sought to be conferred on the General Assembly of passing upon the election of professors in the seminaries by approval or disapproval were no more than it now possessed over a majority of the seminaries; and that certain other conditions asked in respect to the election of professors simply corresponded in substance and effect with what was known as the agreement of 1870.

The seminaries of Omaha and Dubuque had adopted all the recommendations of the General Assembly. The directors and trustees of Princeton Seminary acquiesced in and were in full sympathy with the sentiment of the resolutions, but were advised by their counsel that the character of the seminary embodied substantially all that the Assembly was seeking to accomplish. Yet they would consent to an amendment if the Assembly still wished it. [The Assembly advised amendment "in order to put the matter beyond all possible question."] The Board of Western Seminary, Allegheny, Pa., considered that seminary already in the position which the Assembly was seeking to establish. The directors of Danville Seminary had resolved to adopt the recommendations as to by-laws as a part of their constitution, but feared that their charter could not be amended without danger of forfeiture. [The Assembly requested the board to secure such legislation as they could without imperiling their charter.] The seminary at San Francisco being under synodical control, it was deemed best to defer action until after the next meeting of the synod. Lane Seminary, at Cincinnati, had been visited by a subcommittee, who found the trustees ready to do all in their power to bring the institution into closer relations with the Church. The report of the committee and its recommendations, with the following resolutions, were adopted by a vote of 432 to 99:

1. That it is the sense of the Assembly that the Assembly of 1894 did not intend to prepare the way for any change in the tenure or management of the property of the seminaries or to do anything which can affect the autonomy of the seminaries, and that the said recommendations were intended to have the meaning and effect as recited in this committee's report. This Assembly, in reaffirming the resolution of the Assembly of 1894, does so with the avowed purpose of leaving the tenure and title to all property of the seminaries exactly where they are now, in the hands of various boards of trustees, and with the further purpose of securing the veto power to the Assembly, as an effective force by charter provision and of safeguarding by charter declaration, the trusts held and to be held by boards of trustees against perversion or misuse.

2. That this General Assembly reaffirms the action of the Assembly of 1894, and, in view of the progress made and the importance of the interests involved, declares that in its judgment the effort should be continued to secure the adoption in substance of the Assembly's plan by all the seminaries.

3. That a committee be appointed to have further charge of this matter, and to make report to the next General Assembly.

The committee was further requested to inquire into and report to the next General Assembly as to the rights of the Church in the property now held by the Union Seminary in New York, and to recommend what measures should be taken to enforce them.

The Committee on Church Unity reported:

The action of the last Assembly with reference to the correspondence with a Protestant Episcopal commission was transmitted to the commission, and since that your committee has addressed nothing to it. The commission has acknowledged the receipt of the committee's letter and assured us that it would be laid before the General Convention which meets in January. They add for themselves that they regard the action of the General Assembly as an expression of a desire on its part that all negotiations between the two bodies shall cease. For the purpose of correcting this erroneous interpretation of the action of the last General Assembly, your committee proposes to write to the commission to the effect that the General Assembly by its action did not direct that all negotiations shall cease, but that they be suspended until the General Convention shall take action upon the subject of mutual recognition and reciprocity referred to by the resolutions of the Assembly.

The General Assembly of 1894 postponed the consideration of the plan of federation which this committee had reported to it until this year, and sent the plan down to the presbyteries for information and advice. The motion to transmit it to the presbyteries did not originate with the committee; it came from the floor of the Assembly. The stated clerk of the Assembly has furnished the committee with the reports from the presbytery. One hundred and sixty-three have been reported as having taken action on the plan. Of these, 50 expressed their disapproval of the plan, without giving any reasons or offering any advice; 17 have disapproved, accompanying their disapproval with reasons for their action; 6 expressed themselves out of sympathy with the movement, 2 of them recommending its discontinuance; 22 express approval of the movement and desire its accomplishment, while objecting to parts of the pending plan; 100 give their approval to the plan, 17 of them, however, taking exception to the equal-representation provision and suggesting the amendment of that; 32 have either taken no action or their action has not been reported; 11 have been reported as in the former class.

It thus appears that a majority of all whose action has been reported have approved of the plan, and that a majority of the whole number of presbyteries on the roll are in sympathy with the federation movement, a large number of these who object to some features in the pending plan desiring the negotiations to be carried on to a successful conclusion.

Federation, it is thus manifest, has a strong hold upon the mind of the Church. This General Assembly could not, if dissatisfied with the reported plan, unannouncedly discontinue the negotiations with the other churches; for its predecessor of 1890 not only unanimously committed the Church to the movement, but directed its committee to invite the other churches to enter it; and it would be a pointed discourtesy at once to terminate the negotiations because of dissatisfaction with the first plan agreed upon by the committees without a further effort to reach a harmonious agreement, nor would such a course meet with the approval of our Church at large. And it also appears that the sentiment in favor of the pending plan is widespread and decided. A majority of the acting presbyteries have approved of it, some, however, taking exception to the rule of representation that the plan contains; and all who disapprove of the plan and give the reasons, while differing on other points, agree in opposing that feature of it. The committee could not, in courtesy to the committees of the other churches, which unanimously

agreed upon this, recommend the General Assembly to declare in favor of a change in the plan in this or any other respect. Moreover, such action, if taken by the Assembly, would greatly complicate the movement. The highest judicatures of two of the largest churches have adopted the plan as it stands. The United Presbyterian General Assembly has so done, and has also elected its delegates to the Federal Council. The General Synod of the Dutch Reformed Church in America has also adopted it and transmitted it to the churches (presbyteries) for their action, and a majority of these churches have ratified the adoption. One of the smaller bodies, the General Synod of the Reformed Presbyterian Church, has also adopted the plan. An amendment here of any particular, or the declaration that an amendment is desired, would compel a reconsideration in those bodies, involve further confusion on the part of the committee, and so delay the consummation of the movement. The committee agreed to the equality of representation, because it is all other fellowship with which it was familiar than rule prevailed. If, however, the majority of the members of the General Assembly desired amendments, the committee would seek to secure what would be acceptable to all the churches.

Recalling the fact that the General Assembly of the (Southern) Presbyterian Church in the United States at its quarter-centennial session in Augusta, Ga., in 1898, had addressed a fraternal letter to the Assembly, "which was marked by expressions of kindly regard and sympathy, the Assembly, upon the recommendation of its Committee of Correspondence, on this quarter-centennial of the reunited northern Church sent a responsive fraternal letter to the Southern Presbyterian General Assembly, in session at Dallas, Texas, in which it said, regarding organic union":

We would stir up your pure minds by way of remembrance touching the attitude which we have steadily maintained for years toward that organic union which would make us one in fact as well as in faith. While we do not propose to press this thought unduly upon your minds and hearts, we do desire again to assure you of our readiness to incorporate any advances which you may be led to make in this direction under the guidance of Christ, who prayed that we may be one.

To an overture from the Presbytery of New York, asking instructions in relation to its duty toward students applying to be taken under its care who are pursuing or propose to pursue their studies in theological seminaries respecting whose teaching the General Assembly disavows responsibility, answer was returned:

We recognize the general principle that a young man should stand on his own as provided by examination for entrance into the Presbyterian ministry, yet:

I. It is the genius of the whole Presbyterian system to educate its ministers through careful training and presbyterial supervision, and to make official provision that all who are admitted as teachers be sound in the faith. (Form of Govt., sec. 1, chap. 1.)

II. Our Book requires that, "except in extraordinary cases," before licensing the candidate "shall have studied divinity at least two years under some approved divines or professors of theology." (Form of Govt., sec. 4, chap. 1.)

III. The General Assembly of 1898 recommended every presbytery "under their own" "to inspect the education of their youth (those preparing for the ministry) during the course of both their academic and theological studies, choosing the best, best schools, seminaries, and teachers as they may judge

most proper and advantageous; so as eventually to bring them into the ministry well furnished for their work." (Baird's Digest, p. 398.)

IV. The General Assembly of 1894 affirmed that it is the privilege of the presbytery to direct "the education of their students within reasonable limits in schools approved by the General Assembly, and to prohibit their attendance at institutions disapproved by the same." (Min., 1894, p. 125.)

Therefore, inasmuch as obedience to the constitution of the Church is obligatory on all presbyteries, we recommend that in accordance with the provisions of the Form of Government above cited, the Presbytery of New York be instructed and enjoined not to receive under its care for licensure students who are pursuing or purpose to pursue their studies in theological seminaries respecting whose teaching the General Assembly disavows responsibility.

A special committee was appointed to consider the whole subject of young people's societies and their relations to the Church, and report to the next General Assembly. Concerning the general finance of the Church and its boards, the Committee on Systematic Benevolence reported

That the decrease in receipts was much smaller, considering the crippled finances of the country and of the Church, than might have been reasonably expected, and advised that an apportionment be made to the different presbyteries of the various amounts recommended by the Assembly, including all the agencies of the Church; this apportionment should be based upon the average percentage of the congregational expenses and total offerings made by the presbyteries during the past two years, less bequests.

A minute was adopted, in view of a recent session of Congress on Sunday, protesting against "the legislative branch of the Government of the people of the United States at any time violating the law of God by meeting or continuing in session on the Sabbath day." The Assembly recommended:

That citizens of the United States who feel justly aggrieved by the action of the late Congress in remaining in session on the Lord's Day be requested and urged to send petitions to both Houses of Congress, petitioning the Congress of the United States to have respect unto the God of the universe by observing his law touching the proper observance of the Sabbath day.

The report on temperance, besides reaffirming the previous temperance deliverances of the assemblies "in unbroken line for more than eighty years," urged the importance of endeavoring to secure the election and appointment to official position of men of clean records on the subject; recommended the more diligent instruction of children and youth upon it; and expressed the judgment of the Assembly that

The time has come when Christian men should make their influence felt directly and with power at the ballot box; and that all voters connected with our communion are urged to vote against the granting of licenses for the sale of intoxicating liquors;

Urging upon the people the desirability of demanding the enforcement of the liquor law throughout the land; and declaring that

Whereas, it is the duty of the Church of Jesus Christ to avoid even the appearance of evil, and whereas there is a well-grounded belief that danger lies in the use of fermented wine at the communion table, therefore it is the sense of this Assembly that unfermented fruit of the vine fulfills every condition in the celebration of the sacrament.

The present year was the twenty-fifth year of the existence of this, the reunited Presbyterian Church as a single body, after a division that had lasted many years into two branches, popularly known severally as the Old School and the New School General Assemblies, the union having been formally consummated in 1870, in the Third Presbyterian Church of Pittsburg, Pa., the same church in which the present General Assembly was held. An evening session on Thursday, May 23, was devoted to the celebration of the "silver wedding of the United Church." Addresses were made on "The Presbyterian System of Doctrine," by President Francis L. Patten, of Princeton University; "The Influence of the Presbyterian Church upon Other Churches," by President Henry M. Booth, of Auburn Theological Seminary; and "The Growth and Future of the United Church," by W. H. Roberts, D. D., Stated Clerk of the General Assembly. Dr. Roberts's paper contained a history of the union and a view of the growth of the Church since it was effected. Of the history, it said

The Presbyterian Church in the United States of America was divided into two bodies in 1838, in part by theological differences, but mainly upon issues of policy and administration. The Presbyterian Churches generally have never divided upon doctrinal questions, the wedge of division has always had as its keen and separating edge some practical question which all persons can understand and with which all are in some manner connected. In 1838 chief among practical questions was the conduct by the Presbyterian Church of its missionary work through agencies under its own control. That question was settled for the Old School Church by the creation of the Presbyterian Board of Foreign Missions in 1838, and by the New School Church in 1862, by the establishment, in response to the demands of its ministers and members, of the Permanent Committee of Home Missions. This action was the initial step in reunion, for it was the full acceptance on the part of the New School of the principle that the Church must control its own agencies. This decisive act was followed four years later by a proposal for reunion made by the New School Assembly, a proposal received by the Old School Assembly in the fraternal spirit which prompted it. The negotiations were carried forward by committees appointed by the General Assemblies of both Churches until May, 1869, when the two Assemblies, convened in the city of New York, sent down what is called the "basis of union" to the presbyteries for their consideration. The answers to this overture were reported at Pittsburg, Pa., at an adjourned meeting held in this Third Church in November, 1869. The vote of the presbyteries upon the overture was 239 in the affirmative to 3 in the negative, all the New School presbyteries voting in favor of the union. On Nov. 12 the two Assemblies, led by those saintly and now sainted men, Melancthon W. Jacobus and Philemon Halsead Fowler, entered arm in arm into this historic edifice and proclaimed, in the name of God, the reunion of the two branches of the Church. The completion of reunion was followed by the gathering of the commissioners and officers of the two Assemblies into what was known as the Reunion Convention.

Since that time the Church has prospered in a marked degree in nearly all the departments of church activity, as shown, first, by the statistics of organizations and persons. The local churches, instead of being diminished by the union of the two bodies, increased from 4,526 in 1870 to 7,387 in 1894. Ordained ministers, who numbered in 1870 4,238, were in 1894 6,641. The communicants, in 1870 446,561, increased in the quarter century to 895,997, an in-

crease of more than 100 per cent. And the members, teachers, and officers of the Sabbath schools during the same period advanced numerically from 448,857 to 561,199, an increase of 112 per cent.

Next, the statistics of contributions. The contributions for congregational purposes were in 1870 \$6,416,480, and in 1894 \$10,200,761. The contributions for miscellaneous benevolent work, in 1870 \$600,846, rose in 1894 to \$1,025,805, and those to the boards of the General Assembly in the former year \$1,500,000, were in the latter \$2,600,931. The advance in the contributions to the boards can best be appreciated by the fact that the sum recommended by the General Assembly to be contributed for the interests of one of the boards in 1894 was within \$50,000 of the sum total of all contributions to all the boards in 1890.

The total contributions to the benevolent agencies of the Church for the period as reported in the Minutes of General Assembly, were as follow: Home missions, \$15,320,520; foreign missions, \$13,528,544; education, \$4,424,054; publication and Sunday-school work, \$1,588,226; church erection, \$2,618,723; relief, \$5,307,155; freedmen, \$1,953,560; aid for colleges, \$1,211,558; sustentation, \$902,776; total, \$47,794,438.

In addition to the contributions to the boards the churches gave the sum of \$24,280,002 to miscellaneous benevolence and \$192,044,780 to congregational support, or a grand total of all contributions of \$263,620,208.

During the quarter century the Church had added, chiefly through the Board of Aid for Colleges and Academies, established in 1883, in the establishment of more than 40 institutions of learning; the Sabbath-school department of the Board of Publication had been reorganized; the Board of Church Erection had aided in the erection of 3,778 church edifices, of a total value of nearly \$12,000,000; the Board of Home Missions had spent fully \$10,000,000 west of the Mississippi, and the region, virtually unoccupied in 1870 except in Missouri, was now dotted with Presbyterian churches; the Woman's Board had come into existence and developed its work within this period. While the total number of disciples in the foreign missions was less than 3,000 in 1870, there were added to the Church in the single year 1894 3,141 converts, and the medical missions were caring for the bodies as well as the souls of men. The number of theological seminaries had been increased by 3, the number of their students had been doubled, and their financial resources had been quadrupled. The first organization of women for Church work within the denomination was formed in Philadelphia in 1870. The establishment of the Woman's Foreign Missionary Society was followed in time by the organization of 5 other similar societies in different parts of the Church. The Woman's Executive Committee of Home Missions was organized in 1878, and the work of the missions among the freedmen was assigned to its care in 1885. The women's societies had contributed the sum of \$630,000 to home and foreign missionary work. From 1870 to 1894 1,040,949 persons, of whom 362,344 were adults, were added to the Church on profession of faith; and 362,344 adults and 515,559 infants were baptized.

The converts added to the Church from 1789, the date of the first General Assembly, until 1899, a period of eighty years, numbered about 830,000, as against 1,040,000 persons added on

profession during the past twenty-five years, and the total benevolent gifts of the period first named were not in excess of \$12,000,000, as against \$71,000,000 for the second period.

II. Presbyterian Church in the United States.—The following is a summary of the statistics of this Church, which were presented to the General Assembly in May: Number of synods, 13; of presbyteries, 74; of elders, 1,537; of candidates, 425; of licentiates, 79; of churches, 2,776; of churches organized, 20; of communicants, 293,509; of members added during the year on examination, 12,539; of baptisms, 5,031 of adults and 3,200 of infants; of baptized non-communicants, 55,369; of teachers in Sunday schools and Bible classes, 18,294; of pupils in the same, 138,069. Amounts of contributions: For Assembly's home missions, \$22,760; for local home missions, \$28,222; for the invalid fund, \$12,256; for foreign missions, \$111,877; for education, \$51,949; for publication, \$7,409; for school evangelization, \$9,627; for the Bible cause, \$4,482; presbyterial contributions, \$14,073; for pastors' salaries, \$724,707; congregational contributions, \$907,121; miscellaneous, \$96,481; total contributions, \$1,890,726. The number of communicants is 4,812 greater, and the total amount of contributions \$3,212 less than in 1894. The reports also record 60 licenses, 67 ordinations, and 139 installations of ministers, and give the number of ruling elders as 8,484 and of deacons as 6,095.

The total receipts for the year of the Executive Committee on Education had been \$27,365. Two hundred and forty-two candidates were assisted in sums of from \$35 to \$75 each.

The Executive Committee of Publication reported total net assets of \$168,849. Ten colporteurs had been employed, who had distributed books and tracts valued at \$7,633. The publishing department had sent out 123,000 copies of books, tracts, etc. Forty-three publications had been issued, 11 of which were new.

The Executive Committee of Home Missions returned its total income for the year as having been \$48,877. The receipts for the home mission department had been \$22,867, of which \$20,035 had been expended in the support of 96 ministers and 2 candidates. Seven teachers had also been supported. The receipts for the invalid fund had been \$12,221. One hundred and thirty-four cases had been aided. From the regular loan fund, which was instituted by the Assembly of 1886, \$6,325 had been loaned to 47 white congregations and \$255 to 5 colored congregations, to aid in the erection or repair of church buildings. The total amount loaned up to March 31, 1895, had been \$8,790, of which \$2,683 had been paid. From the William A. Moore fund of \$5,000, left to be loaned at 5 per cent. to feeble congregations to enable them to erect houses of worship, \$1,350 had been loaned during the year to 5 churches. The amount loaned had been \$3,050 to 11 congregations.

Reports were made of 3 theological seminaries—viz., Union Seminary, Virginia, 2 professors and 70 students; the divinity school of Southwestern Presbyterian University, 6 professors and 30 students; Louisville Seminary, 4 professors and 32 students; Columbia Seminary, 21 students; Austin Seminary, no particulars.

The Executive Committee on Colored Evangelization, in its fourth annual report, returned the expenditure for the year as having been \$3,200, and reported that \$1,211 were in the treasury. The work of the committee and of the Institute for Training Colored Ministers, at Tuscaloosa, Ala., had been hampered for lack of funds. A tract of 300 acres of land had been obtained, on which a building for church and school purposes was in course of erection. The committee hoped to be able to begin at an early day a more commodious building for school and dormitory purposes; also machine and carpenter's shops, blacksmith shops, brickyards, sawmills, and other needed improvements. At least \$6,000 were needed to get the school into proper condition. Many of the best students coming to the institute were married men, some of them with large families.

The Assembly's Home and School, at Fredericksburg, Va., returned assets of \$27,750, which were \$14,100 in excess of indebtedness. The object of this institution is to maintain and educate the orphans of ministers, the children of the foreign missionaries who have to be sent home for education, and the children of the home missionaries who labor in fields destitute of educational facilities upon salaries insufficient for the education of their children.

A training school, designed to give a "Scriptural and sensible method of training for Christian work, especially for young women who desire to be fitted for home or foreign missions," was to be opened at Fredericksburg in September, 1895.

The receipts for foreign missions were \$132,333, or \$9,106 less than the receipts of the previous year, and the disbursements exceeded the receipts by \$1,377. The fiscal year had closed without debt and leaving a balance in the treasury, including the Congo Boat fund, of \$16,865. Twelve new missionaries had been sent out, 2 missionaries had died, and 5 had returned to the United States. On account of dissensions that had occurred there, the Cuba mission had been suspended for the present. A project for building a boat for the use of the missions on the Congo river, for which \$10,380 had been contributed had been delayed till the need for the boat became more evident.

The General Assembly met at Dallas, Texas, May 16. The Rev. C. R. Hemphill, D. D., of Louisville, Ky., was unanimously chosen moderator. A number of overtures were presented on the subject of organic union with the Northern Church, some of which asked for the appointment of a committee of 9 to confer with a similar committee of that Church, while a variety of views were expressed in the others. To these a reply, unanimously adopted, was returned, that "the Assembly does not deem it wise to agitate these questions at this time, and places on record its sentiments of sincere regard and Christian affection for that honored branch of the great Presbyterian Church, with whom we now have the closest fraternal relations." A letter was read from the Franco-American Evangelization Society, asking for sympathy and encouragement in its efforts, in reply to which a minute was adopted recording and publishing the "tender love of the Assem-

bly to the Huguenot Church in France, commending it to the prayers, sympathies, and help of the people," and inviting the stronger churches to contribute regularly to the Franco-American commission. An invitation having been received from a committee of the Synod of New Jersey to participate in the celebration June 4, 1895, of the earliest meeting of a presbytery in the United States, which took place near Monmouth, N. J., in 1706, the Assembly expressed its great interest in all matters concerning the founding and early struggles of the Presbyterians in this country, and named delegates to attend the celebration at their own expense. On the subject of the organization of an independent colored Presbyterian Church, the Assembly declared that the ultimate carrying out of such a measure had always been the policy of the Church. During the past five years steady progress had been made toward this goal. The question of organization was referred to the presbyteries and synods concerned for such action as they might see proper. If their concurrence is obtained, and if the funds raised justify such organization in the judgment of the Committee of Colored Evangelization, a special committee was authorized to determine the time and place for effecting the organization and represent the Assembly in the proceedings. A report on young people's societies was adopted with a constitution and form of government. The action of the previous Assembly declining to forbid affiliation with the societies of other Churches and enjoining the sessions to maintain a careful oversight of the nature and influence of such associations was reiterated. A special warning was given "against the danger to which young and inexperienced persons are exposed from attendance upon large and promiscuous conventions which are not under ecclesiastical control." The Committee of Education was authorized to grant aid to unmarried women who are under the care of the Committee of Foreign Missions while pursuing their studies in the training schools of the Church. The standing Committee on the Sabbath reported that only a few presbyteries mentioned improvement in their reports; that a general survey of the field showed a "down-grade" movement; that the growing tendency among Christians to admit the secular spirit into their homes was to be deplored; and that it was a matter of deep regret that so wide a difference exists among Christians as to what constitute lawful and unlawful works on the Sabbath day. The Permanent Committee on the Sabbath, which was commissioned by the previous General Assembly to consider the whole question of Sabbath observance under the changed conditions of modern life, reported that

The general trend is in the direction of lower views and practices, and that whatever may be affirmed by God's people the day is unmistakably losing its hold upon the masses. If, however, in this respect the line was sharply drawn between the Churches and the world, if the demoralization and the decline were confined simply to the outside world, there would be little or no ground for uneasiness; but, unfortunately, this is not the case. The spirit of indifference is likewise invading the ranks of the Church. There is a large class among all denomina-

there . . . who, with the exception of business and the more servile forms of labor, would not scruple to use the Sabbath as any other day, especially in the direction of recreation and pleasure. . . . It is this smug indifference as well as palpable disloyalty to the day on the part of so many of its professed friends that so much emboldens the world in setting aside its authority. Only let the Churches and Christian people be true to their professions and the enmity of the Lord will never be able to shake, much less overturn this stronghold of Christianity. If ever overturned, it will be more through the perfidy of its friends than the assaults of its foes. Not until all the different denominations of Christians stand shoulder to shoulder in the breach and unitedly maintain the absolute and perpetual sanctity of this day of the Lord can we really and truly expect the ungodly world to render that reverence and respect which are justly its due.

In answer to an overture from the Presbytery of Macon complaining of the employment of hired and professional singers in the churches the Assembly referred the presbytery to the paragraph in the Book of Church Order, in which the power of the church session is defined, and the session of each church is directed "to take the oversight of the singing in the public worship of God," and enjoined such oversight by the sessions as would make the music conform to the Church standards. The Assembly reiterated the deliverances of previous Assemblies on the subject of temperance, and "without any reference to the political aspect of the temperance reform," urged upon all Christians "the duty of using all legitimate means to promote the cause of good citizenship, especially by refusing to be identified with the liquor traffic"; and deprecated the inconsistency "of professing Christians who rent their property for immoral purposes." A letter of fraternal greeting was sent to the Northern General Assembly, in which, after congratulating that body upon attaining the twenty-fifth anniversary of the United Church, the Assembly said:

We are fully one with you in all the fundamental commitments of the holy Catholic Church. Most especially, brethren beloved, we thank you for that truly fraternal spirit and delicate appreciation of our spirit which makes your letter so very precious and so fragrant to us. Let us walk together in full fraternity of love and sympathy in all the great numberless things in which we are agreed, and thus be encouraged to pray and hope that if in anything we differ God may reveal even that unto us and take away every hindrance.

III. United Presbyterian Church in North America.—The statistical tables of this Church for 1895 give it 801 ministers, 895 churches, and 106,755 communicants.

The missions in India were carried on at 11 mission centers or districts, with 11 ordained American missionaries, 13 single women, 2 women medical missionaries, 6 native ministers, 193 other native helpers, 3,058 communicant members, and 3,280 baptized adults, making a total of 6,347 baptized members; and 126 schools, with 4,600 pupils. The contributions by natives directly for Church purposes were \$442. More than 30,000 patients—old and new—were treated in the hospitals. The mission in Egypt returned 15 ordained American missionaries and their wives and 8 unmarried woman missionaries; 33 organized congregations, 19 of which

had native pastors, while work was carried on in 134 other places; 4,554 members, of whom 1,930 were women, and 500 were added during 1894; 21 libraries and 9 students of theology; 110 Sabbath schools with 3,265 pupils, and 119 week-day schools with 7,975 pupils. The native members had contributed \$11,500, and had paid more than \$17,000 for tuition, etc. The fact was noticed that the proportion of female members to male members was increasing from year to year.

The General Assembly met in Pottsburg, Pa., May 22. The Rev. J. R. McMichael, D. D., was chosen moderator. An organ having been used during the services at the opening of the Assembly, the Rev. Dr. J. G. Carson, who had been one of the most active opponents of the introduction of instrumental music in worship, and who had signed a protest against the action of the Assembly in 1893 permitting it as well as other protests on the subject, asked leave to change his protests into a dissent.

He said that he had signed the protests in good faith and with the conviction that he was under obligations to promote his efforts to have the Church retrace its steps, and also that in the event of his failure to do this he might feel constrained to withdraw from the Church. The time had now come when he must decide. With his protests on record, he was, according to his convictions, restrained from taking part in worship when the instrument was used. He found himself alone; his brethren of like views did not feel constrained to refuse to join in such worship under present circumstances. He was unwilling to separate himself from the Church. It was the privilege of every member to state his dissent from any action taken, thus freeing his conscience without the sense of obligation to renounce his opinion or to separate himself. There was now no hope of having the Church change its course on this subject, and he wished to be in a position to aid his brethren in worship and work. His protest was entered on the minutes.

An appeal against the action of the Synod of Ohio confirming the decision of the lower courts was made by Mr. J. K. Andrew, who had been suspended by the session of the Church in Londonderry, Ohio, for "making determined opposition to one of the principles of the United Presbyterian Church, viz., that the first day of the week is the holy Sabbath." The Assembly decided that "the complainant, by his plea against his own public profession and against the public profession of the Church, has claimed no standing in the Church." The Committee on Union with the Holland Christian Reformed Church reported as the result of a conference with the committee of that Church and of a statement of its doctrine and usage that there appeared to be a substantial agreement between the two Churches, even in the details of their distinctive principles. But as there was a difference of nationality and of historic life an organic union was not now practicable. Instead thereof a plan of full mutual recognition was proposed, providing for a constant interchange of fraternal delegates for the exchange of pulpits by ministers, for liberty to congregations of either body to call ministers from the other, for mutual recognition of certificates of membership, and for co-operation in mission work. The report was adopted, and a committee was appointed to visit the Holland Synod of 1896. The

canvass of the votes of the presbyteries on the two overtures concerning control by the General Assembly over the theological seminaries, which had been sent down in the previous year, showed that both overtures had been adopted by very large majorities. The overtures were:

1. Shall the General Assembly have the veto power in the election of professors in our theological seminaries?

2. Shall the General Assembly have the power to remove a professor for unsoundness in the faith?

The overtures were declared enacted as a part of the constitutional law of the Church, to be entered as such in the Book of Government on the approval by the presbyteries of the necessary changes to be made in that book, provided that this action was not to be taken as interfering with the vested rights of synods exercising control over existing seminaries further than may be indicated in the language of the overtures themselves. It was ordered that the directors of the seminaries be required to report annually on all matters coming under the oversight of the Assembly. A committee was appointed to negotiate with the synods having control of theological seminaries with a view to the adjustment of any apparent or alleged discrepancies between this action and their chartered rights.

IV. Reformed Presbyterian Church.—The Synod of the Reformed Presbyterian Church in North America met at Denver, Col., June 6. The Rev. J. Milligan Wylie, of Denver, was chosen moderator. The condition of the mission in Turkey, which was embarrassed by opposition of the officers of the Government, was considered. The subject of the appointment of missionaries to China, decided upon three years before, but not yet carried into execution, was referred to the Board of Foreign Missions. More than \$4,000 had been deposited in the treasury for the purpose of this work. The report on national reform recognized in the society called the National Reform Association, an organization which aimed to provide a way by which all who favor such a radical change in the Constitution of the United States as will make it distinctively Christian and yet are not prepared to accept the Covenanter Church's position of political dissent, "can consistently co-operate in a common effort to bring this nation into acknowledged subjection to Christ." The association was therefore recommended to the continued and hearty support of the members of the Church, and \$7,000 was appropriated to assist in its work. The report on "Testimony bearing," or the declaration of political dissent, showed that the work had been carried on with vigor, and the appointment of Dr. McFarland as the Synod's lecturer on the subject was continued. A report on co-operation with the Woman's Christian Temperance Union, the Young Men's Christian Association, the Christian Endeavor societies, etc., recognized such bodies as evidently the outgrowth of the Christian religion and the result of the Spirit's operation, and as calling for the co-operation of all Christians "so far as they are right as to their objects and the means used in their prosecution." Yet, inasmuch as the Synod condemned entirely "the use of uninspired psalmody in the worship of God" it recom-

mended that the people of the Church be warned when taking part in conventions for moral reform and other purposes where human compositions are used in praise not to participate in their use; and that the influence of the Synod be used so far as possible to have an "inspired Psalmody" used in all these conventions. The Theological Seminary was declared open for godly women who desire to fit themselves for missionary or evangelistic work. The resolution is interpreted as not contemplating the licensing and ordaining of women to preach the Gospel, but the better qualification of those who do missionary work at home or abroad for their calling. Thanks were voted to the Government of the United States for protection given to the missionaries in Turkey. Efforts to bring the mission churches in Syria to a standard of self-support were advised.

V. Cumberland Presbyterian Church.—This Church returns for 1895 1,704 ministers, 2,884 churches, and 193,393 communicants. The Cumberland Presbyterian Church, Colored, has 400 ministers, 250 churches, and 13,250 members.

The receipts of the Board of Education for the year had been \$10,092, or \$1,605 more than in the previous year. The number of probationers in schools of all grades was returned as 225.

The Board of Publication reported that the indebtedness of the publishing house had been reduced by about \$4,000, while \$14,782 were due it, and that the net gain of the year was more than \$3,000. The sales amounted to \$10,981.

Of the recorded Christian Endeavor societies, 550 in number, with a probable membership of 16,000, only 350 had reported, with 12,000 members. Ninety-two of these were junior societies, with 2,265 members.

Five educational institutions—Cumberland University, Lincoln University, Missouri Valley College, Trinity University, and Waynesburg College—returned 1,040 literary students, 193 ministerial and 78 law students, and 113 students not classified, with funds: productive endowment, \$311,884; nonproductive endowment, \$123,000; and buildings and grounds, \$375,000.

The Board of Missions returned the total amount received for its work as having been \$71,884, the largest sum ever reported in a single year. It had the care of 21 home-mission churches, while much activity was manifested in State organizations. The foreign work was carried on in Mexico, where a further development of the schools was advised, and in Japan. The sum of \$2,183 had been loaned in the Church Erection Department, in behalf of which increased interest appeared to be manifested in the churches.

The treasurer of the Woman's Board of Foreign Missions reported that the receipts for the year had been \$15,267, or including the balance from the previous year, \$18,685.

The sixty-fifth General Assembly met in Meridian, Miss., May 16. The Rev. M. B. De Witt, D. D., of Missouri, was chosen moderator. An appeal was presented from Nolin Presbytery, asking for a reopening of the case of Mrs. Woosley, which arose in the General Assembly of 1893, and for a deliverance as to her rights as an ordained preacher. Two reports were presented. The majority report denied the validity of the

action of the Kentucky Synod declaring Mrs. Woosley's ordination invalid and also of the action of the General Assembly, and advised that the case be not reopened. The minority report held that the General Assembly at Eugene, Oregon, did, by consent of Mrs. Woosley and those who agitated the question, take jurisdiction of the subject, that it confirmed the action of the Kentucky Synod and declared the ordination of Mrs. Woosley invalid, and that its decision was final. The conclusion was reached that Nolin Presbytery had not regarded the authority of the higher courts, and hence the appeal should be dismissed. The minority report was adopted. A minute was adopted referring to the theological faculty a proposition contemplating the delivery of a course of lectures on the Holy Spirit, and declaring that the nomination of professors by the General Assembly would not be in keeping with the original agreement concerning the selection of professors; also expressing pleasure at efforts that were being made by the Synod of Illinois to found a divinity school in connection with Chicago University for the proper training of Cumberland Presbyterian young men. A declaration was made in favor of systematic and proportionate giving in the proportion of at least one tenth of the giver's income for the support of Christian work, and measures were advised for encouraging the general adoption of the plan. The report on temperance declared it to be the duty of Christian citizens to vote and labor for the suppression of the liquor traffic. The Assembly advised that a Christian Endeavor union be formed in every presbytery, disapproved of Union Christian Endeavor societies, and suggested that a series of books or tracts for the young people be prepared on the subjects of the history of the Cumberland Presbyterian Church, a statement of Christian doctrine and the doctrine of the Cumberland Presbyterian Church, systematic giving, the history and claims of the Church enterprises, Sunday schools and Sunday-school work, the history of Cumberland Presbyterian Endeavor work, and brief biographies of the men and women of the Church. The report on Sabbath observance recommended that ministers, church officers, and members pledge themselves to be more careful in keeping the Sabbath day holy; declared pastors and elders to be largely responsible for the growing neglect of the Sabbath; and condemned Sunday railroad trains, Sunday newspapers, and Sunday visiting. On the subject of Presbyterian federation the Assembly declared that no gain would come to the Church by entering the proposed federation, while it would involve additional and needless machinery and expense, and therefore declined to approve the plan. Presbyteries were instructed, under penalty of censure, and if necessary of dissolution, to demand that all candidates for ordination shall have proper training and education.

The General Assembly of the Cumberland Presbyterian Church, Colored, met in Nashville, Tenn., May 6. The Rev. Pinkney Price, of Topeka, Kan., was elected moderator. About 25 commissioners were in attendance, 19 of whom were ministers. Twelve presbyteries, in the States of Tennessee, Kentucky, Alabama, Kansas, Missouri, and Illinois, were represented. A

committee was appointed to select a place for a denominational school and put the school in operation.

VI. Presbyterian Church in Canada.—

The following is a summary of the statistical reports of this Church presented to the General Assembly in June: Number of churches and stations, 2,839; of sittings, \$17,317; of families, 93,635; of communicants, 179,579; of persons engaged in Sabbath-school work, 17,443; of members of Sabbath school and Bible classes, 134,639; of baptisms during the year, 1,368 of adults and 11,029 of infants; of additions in profession, 12,922. Amount of contributions: To the Home Mission fund, \$63,703; to the Augmentation fund, \$31,407; to French evangelization, \$25,239; to the Foreign Mission fund, by congregations, \$20,686; through the Woman's Foreign Missionary societies, \$28,779; to the Aged and Infirm Ministers' fund, \$2,007; to the Endowment fund, \$4,005; to the Widows' and Orphans' fund, \$5,654; to the Assembly Expense fund, \$3,906. Stipends received from all sources, \$708,248, of which \$28,795 were paid by congregations alone. The total payments for congregational objects were \$1,719,266; payments to the college funds, ordinary, were \$24,242; and to the special fund, \$17,000.

Sixteen presbyteries reported 1,008 Sabbath schools, with 17,327 officers and teachers and 153,013 pupils; while the contributions of the schools were returned at \$62,000.

The total receipts for French evangelization were \$34,115. Twenty-five pastors, ordained missionaries, and licentiates, 10 student missionaries, 7 colporteurs, and 23 teachers were employed in the work, in 36 mission fields, with 93 preaching stations. Two hundred and three members, 50 of whom were English, had been added during the year; and the whole number of members was 1,106. The Sabbath schools had been attended by 918 pupils. The 20 mission day schools returned 600 enrolled pupils.

The total receipts for home missions, including what had been expended by the presbyteries for the work, had been \$115,714. The receipts of the Eastern section—\$12,280—showed a threefold increase in ten years. This section returned 253 laborers at work. The board of the Western section had 344 mission fields, with 325 missionaries, 14,500 communicants, and 26,000 persons, representing nearly 12,000 families, attending the weekly services. The sum of \$60,000 had been contributed for the support of the "ordinances."

The foreign missions included those to the New Hebrides and Trinidad, for which \$27,493 had been received; those in Formosa, where were 4 ordained missionaries, 60 native ordained preachers, and 1,739 communicants; Honan, China, and India; those to the Indians, on 21 reserves in Manitoba and the Northwest Territories, with the Albert mission as a special work; the Chinese mission in British Columbia; and the Jewish mission in Palestine.

The General Assembly met in London, Ontario, June 13. The Rev. James Robertson was chosen moderator. On the subject of Church union the Assembly reaffirmed its earnest desire to promote, on a scriptural basis, the union of churches which "hold the Head" and are

rendering faithful service to him; expressed its readiness to co-operate with all evangelical churches "in advancing all those holy and beneficent ends for which the Church of Christ has been instituted"; and reappointed its Committee on Union, as in past years, giving it power to confer with any similar bodies representing other churches, regarding matters relating to unions or corporations, as opportunity might offer. The report on Sabbath observance represented that the subject was pressing upon public attention with increasing intensity as vitally identified with the welfare of society and the progress of religion. The Assembly recommended that general conferences be held upon it in every presbytery, and urged the importance of influencing legislators, through deputations or otherwise, to "right views of the Sabbath in relation to national welfare." In reference to the difficulties in the province of Manitoba in connection with the matter of public education, the Assembly resolved:

1. That it belongs to the state to see that the people receive such a measure of education as shall qualify them for the ordinary duties of citizenship. 2. While the duty of giving definite and detailed religious teaching must rest, above all, on the parent and the Church, yet the system of public instruction should be based upon and pervaded by the principles of Christianity, and should give distinct place to the reading of the Scriptures and prayer. 3. The General Assembly does not regard the system of separate schools with favor, and is strongly opposed to this system in Canada. The Assembly would therefore deplore any attempt to interfere with the freedom of Manitoba in determining and regulating its own educational affairs. Such a course in the judgment of the Assembly could result only in evil, and is not, we believe, demanded by any supposed compact between the province and the Dominion, or between different classes of people in the province itself. 4. The General Assembly hopes that this view will prevail with the authorities of the Dominion, and would rejoice should conference between the province and the Dominion lead to a proper and harmonious adjustment in accordance with the view above expressed.

The report on temperance, reiterated the expression of previous Assemblies that "so far as legislation is concerned, nothing short of prohibition, rigidly enforced by the proper authorities, should ever be accepted as final and satisfactory."

VII. Free Church of Scotland.—The General Assembly of the Free Church of Scotland met in Edinburgh May 28. The Rev. Dr. J. Hood Wilson was chosen moderator. With reference to union with the United Presbyterian Church, the Assembly declared that it recognized that union could not be wisely taken until an earnest conviction in favor of it pervaded both Churches, and directed the appointment of a committee to consider the subject, and to embrace every opportunity of placing itself in communication with the United Presbyterian Church. The report on disestablishment maintained that disestablishment and disendowment were acts of justice to the Scottish nation, and that the establishment was the only substantial hindrance to union; and it insisted upon the urgency of the question and reiterated the claim upon the Government for an early and final settlement of it.

In answer to an overture asking the Assembly to inquire into the views of Prof. Drummond as

expressed in his book "The Ascent of Man," the Assembly declared that it could not find grounds for action. It was observed by Principal Rainy, in the discussion on this subject, that ministers and elders were scarcely equipped for dealing with the scientific questions raised, and must allow some liberty of action to a man whom they had placed in a chair the work of which had to run on scientific lines. The Church should not at this time be compelled to formulate its position toward modern scientific theories.

VIII. Church of Scotland.—The summary of the income of the schemes and funds of the Church of Scotland for 1894 shows that the total income was £167,641, as against £62,896 in 1893.

The General Assembly met in Edinburgh May 28. The Rev. Dr. Donald MacLeod was chosen moderator. The report of the Colonial Committee called attention to the great good that might be done in South Africa if an attempt was made to meet the spiritual needs of Scotchmen who were there seeking fortune and adventure. The expenditure for home missions had been £65,000. A larger number of agents had been employed. The Committee on Foreign Missions represented that a reduction of expenditure of £2,344 would be required to avoid debt. The report on Church interests declared that as a principle of united action religious equality did not at present exist. The men who had participated in a voluntary conference of members of the 3 largest Presbyterian churches of Scotland (see below) could be honored for the part they had taken, but they should remember that they were not messengers from the Church, and that they were bound to abide by the declarations of the Assembly. The negotiations, whatever might be their result, must not be allowed to affect the policy of the committee.

IX. United Presbyterian Church of Scotland.—The Synod of the United Presbyterian Church in Scotland met in Edinburgh May 7. The Rev. David Kinnear was chosen moderator. An occasion having been afforded by the presentation of a protest against the net of a minister who had admitted the Rev. David Macrae, of Dundee, excluded, to his pulpit, the Synod, waiving the consideration of personality, expressed disapproval of any minister of the Church allowing any one who had been declared no longer a minister of the Church to occupy his pulpit. A resolution was passed expressing regret that the Government had not been able to introduce its bill for disestablishment and disendowment; regarding as a sign of progress the second reading of the Government's disestablishment bill for Wales; avowing the determination to maintain and advance the voluntary principles of the Church; and pressing on the Executive Committee to do all in its power to hasten the legislative triumph of religious equality.

Conference of Scotch Presbyterian Churches.—A number of representative men of the 3 Presbyterian Churches of Scotland held several conferences during the year relating to the question of union, the aim of which was to draw out and present in a distinct form the extent of agreement existing even on questions coming within the region of controversy. The various findings are given in the published re-

part of the results, under three headings, the first of which relates to reformation and revolutionary statutes. While approving of these statutes in so far as they contain a rejection by the state of the usurped claims of the papal Church, the conference disapproved of them as embodying persecuting principles. It was found that all the members of the conference were agreed in holding that the civil courts are not entitled by the word of God to interfere in the spiritual acts of the Church, and that the rights of the Church in matters spiritual are based not on civil statutes, but on the foundation laid by Christ. "Christ," the finding says, "has conferred on the people individually a spiritual freedom which neither civil nor ecclesiastical authorities are entitled to violate and abridge." The third heading relates to national religion, and here the articles of agreement of the Free and United Presbyterian Churches formulated in 1860 are adopted as a reasonable basis from which to start negotiations for union. An additional statement to these articles contains the assertion: "In order that religion may have national recognition and that a nation may give expression to the homage which it owes to God and to his laws, religion ought to be acknowledged by the state in its Constitution, legislation, and conduct."

X. Presbyterian Church in Ireland.—

The statistical returns of the Presbyterian Church in Ireland for 1894 give the number of ministers as 632, with 56 retired ministers; of congregations as 559, with 104,578 members, representing 82,662 families; and of Sabbath schools as 1,092, with 115,202 members, including those in Bible classes. The whole amount of contributions in 1894 was £193,507.

The General Assembly met in Dublin, June 3. The Rev. G. Buick, LL.D., of Cullybackey, was chosen moderator. The principal topic of discussion concerned the use of hymns in worship. The policy of the Church since its organization by the Union of Synods in 1841 had been to give its sanction of authorization only to the Psalms of David, but to permit congregations to use, on their own responsibility, paraphrases and hymns. A motion was made to withdraw this permission, but was defeated by a large majority, and the Assembly decided that uninspired hymns might be used.

XI. Presbyterian Church in England.—

The Synod of the Presbyterian Church in England met at Newcastle-on-Tyne April 29. The Rev. Richard Leith was chosen moderator. The predominant subject of interest at the meeting was a proposition to remove the college from London to Cambridge, which was carried. A site, together with the sum of £50,000, had been offered the institution at Cambridge. Five ministers were authorized to be set apart for evangelistic work during the year. The appointment was authorized of an agent who should devote his whole energy to the organization of a church building fund, for which £50,000 were desired. Expressions of regret, to be embodied in a pastoral address, were made at the lack of spiritual vigor and aggressiveness in some parts of the Church indicated in the returns, and at the spirit of indifference manifested outside. The temperance society connected with the Church

was represented as making rapid progress. The instruction of youth by Bible teaching in families was commended. The income for foreign missions had been £22,168, showing a deficiency of £5,000. The work of the missions in China had not suffered by the war. It included 125 preaching stations in Amoy, Swatow, Formosa, and Singapore, with 56 European agents, 117 native evangelists, 19 native pastors supported by their congregations, 10 hospitals, and 4,664 communicants. The native Christians were sending missionaries to their countrymen. The Women's Missionary Association had 23 missionaries included in the previous enumeration in China. The society has also small missions in India and to the Jews in London and in Syria. The total amount raised in the Church from all sources during the year was £294,342. Four hundred and fifty Sunday schools returned 7,509 teachers and 82,596 pupils. An increase of 1,412 was reported in the number of communicants.

XII. Welsh Calvinistic Methodist Church.

—The following is a summary of the statistics of this body which were presented to the Assembly in June: Number of churches, 1,206; of chapels and preaching stations, 1,498; of ministers, 799; of communicants, 145,694; of children in the churches, 66,431; of probationers, 2,321; total in the churches, 214,456; of Sunday schools, 1,302, with 193,354 pupils and teachers; of adherents, including communicants, 306,669; total amount of collections, £220,101. The year's increase in church membership was 87,676.

The General Assembly met in London June 10. The Rev. Griffith Ellis was chosen moderator. The parliamentary committee presented a report embodying a plea for disestablishment, which was adopted. The report included a statement of the comparative strength of the 4 principal nonconformist denominations in the principality and of the Established Church in the 4 Welsh dioceses, from which it appeared that among less than 2,000,000 of people the 4 denominations have 881,795 communicants and 999,227 adherents; and the Established Church has 119,756 communicants and 229,002 adherents; majority in favor of the nonconformists, 260,000 communicants and 622,435 adherents. Further, that the nonconformists provide outtings for more than 1,100,000 people, and the Established Church for 450,000; that since 1816 nonconformist chapels have increased from 963 to 4,222, or 429 per cent. in less than eighty years; that between 1872 and 1892 there was an increase of more than 100,000 nonconformist communicants; and that between 1870 and 1892 the contributions of the Calvinistic Church increased 90 per cent. A report on the Welsh showed that between 189,000 and 160,000 Welsh-speaking people were residing in England and that 28,000 people who spoke Welsh lived in London, of whom 8,000 attended Welsh churches, while it was believed that about 4,000 attended English churches, leaving 16,000 speaking Welsh who neglect the means of grace. The financial report showed that the liabilities of the connection were cleared off every six years, while by continued church extension, etc., its debts were kept in the neighborhood of £200,000; and this feature was regarded as a mark of prosperity and enterprise. The "Forward Evangelical Move-

ment," a new scheme of preaching to the masses of people outside the churches is called, now three years old, had 17 evangelists at work, and congregations numbering in the aggregate 6,000 people, with an annual income of £2,000. Eighteen centers of operations had been instituted in the most populous districts of South Wales, and 1 in London, and 2 new ones were to be opened.

XIII. Presbyterian Union in Australia.—A scheme for the Federal Union of the Presbyterian Union of the Presbyterian churches of Australia and Tasmania was agreed upon at a Federal General Assembly held in Sydney in 1895. The acceptance was advised as a basis of union of the Holy Scriptures as the supreme standard and the Confession of Faith as a subordinate standard, with a declaratory statement.

PRINCE EDWARD ISLAND, an eastern province of the Dominion of Canada; population, about 110,000.

Government.—The Executive Council in 1894-95 was as follows: Premier and Attorney-General, Hon. F. Peters; Treasurer and Commissioner of Public Lands, Hon. A. Macmillan; Commissioner of Public Works, Hon. J. R. McLean; members of Council without portfolio, Hon. D. Farquharson, Hon. A. Laird, Hon. P. Sinclair, Hon. J. W. Richards, Hon. G. Forbes, Hon. A. McLaughlin.

Finances.—The receipts for the year ending Dec. 31, 1894, were as follows: Dominion subsidy, \$183,029.37; public lands, \$36,250.08; provincial land tax, \$30,499.38; income tax, \$6,221.53; commercial traveler's license, \$3,825; incorporated companies, \$3,900; ferries, \$5,154.05; prothonotary offices, \$2,386.83; registry offices, \$5,281.99; county courts, \$1,987.88; miscellaneous, \$4,531.87; total, \$282,467.98.

The ordinary expenditure for the year was \$280,595.90, and the special expenditure, mainly for bridges, was \$22,036.29, leaving a deficit of \$20,000. The imposition of new taxes, in 1893, on certain classes of traders, on incomes, on certain incorporated companies, and on successions, did not make ends meet, as was hoped.

Legislation.—The second session of the thirty-second Assembly was opened at Charlottetown by Lieut.-Gov. Howlan, March 21, 1895. J. H. Commiskey was re-elected Speaker. The following acts, among others, were passed:

To provide for the incorporation of cheese and butter manufacturing associations.

Respecting seduction.

To empower the Government of this province to sell certain lands.

For the reclamation of marsh lands.

To prevent the spread of black knot on plum and cherry trees.

Education.—The educational affairs of the province are under the control of a Board of Education appointed by the Government, and of a chief superintendent. The Government expenditure in 1894 was \$122,077, and that of the districts under school-board assessments was \$37,854. It was estimated that there were 24,000 children of school age, of whom 22,221 attended school during some part of the year. The figures show 401 schools, compared with 387 in 1892 and 395 in 1893; 401 teachers, 16,036 pupils, and an average attendance of 8,709.

Fisheries.—The province had 151 fishermen in vessels and 3,178 in boats during 1894. Its vessels, boats, wharves, nets, and general fishing appliances were valued at \$468,736, an increase of \$342,000 in eleven years. The value of the yield was \$1,119,738, and the exports of the province \$447,813.

The distribution and value of the catch in 1894 were as follow: Salmon, \$2,025; herring, \$203,909; haddock, \$6,002; hake, \$28,899; halibut, \$820; oysters, \$96,220; mackerel, \$145,625; cod, \$107,892; lobsters, \$380,770; pollock, \$28,899; smelts, \$36,683; others, \$113,893.

The registered seagoing tonnage carrying cargo into and out of the province was 104,710 tons during 1894. The imports of dutiable goods in 1894 were valued at \$354,153, with a duty of \$161,836; free goods at \$196,839.

PROTESTANT EPISCOPAL CHURCH IN THE UNITED STATES. Comparison of the diocesan statistics for 1894 and 1895 shows a gain during the year in every particular, except that the number of deacons ordained was 28 fewer than last year. The general summary is as follows: Number of dioceses, 58; missionary districts in the United States, 19; missionary jurisdictions in foreign lands, 7; clergy (bishops, 79; priests and deacons, 4,603), 4,682; parishes and missions, 6,118; candidates for holy orders, 558; ordinations, deacons, 193; ordinations, priests, 181; baptisms, 64,752; confirmations, 45,796; communicants, 622,194; marriages, 17,257; burials, 32,677; Sunday-school teachers, 45,635; Sunday-school pupils, 422,984; total of contributions, \$13,507,429.70.

The General Convention met in Minneapolis, Minn., Oct. 2. Little of note in the way of direct legislation was accomplished. Five new dioceses were formed by the division of the sees of Maryland, California, and Kentucky, and by the erection of the missionary jurisdictions of Northern Texas and Northern Michigan into dioceses. Two new missionary jurisdictions were formed by setting off portions of the dioceses of Minnesota and North Carolina as missionary jurisdictions of Duluth and Asheville, respectively. Wyoming and Idaho were made independent missionary districts, with the present bishop in charge of both. Western Colorado was put under the charge of the Bishop of Nevada and Utah, whose title becomes Bishop of Nevada, Utah, and Western Colorado. Part of the territory under the Bishop of Western Texas was added to Northern Texas, and part to New Mexico. The title of the Missionary Bishop of Oklahoma was changed to Missionary Bishop of Oklahoma and the Indian Territory. The Rev. Peter Trimble Rowe was elected Missionary Bishop of Alaska. The revision of the constitution and canons was referred back to the Constitutional Commission, to report again to the General Convention of 1898, which was appointed to meet in Washington the first Wednesday in October, 1898. The pastoral letter issued on Oct. 18, 1894, which solemnly affirmed the virgin birth of our Lord and the inspiration of the Holy Scriptures as matters of faith which no Christian man could question, was reaffirmed by the pastoral issued from Minneapolis.

Missions.—The Board of Missions, consisting of the 2 houses of the General Convention and

of the Board of Managers, convened, Oct. 4, in Minneapolis, Minn., for the triennial meeting, and adjourned on Oct. 18. Resolutions of sympathy with the Armenian Christians, with the missionaries in China, and with the societies of the Church of England whose workers suffered in the recent massacre at Kucheng, and with the Hancock Indians as innocent victims of aggressive outrages, were adopted. The number of members constituting the Commission for Work among the Colored People was reduced from 21 to 15, and it was resolved: "That it be recommended to the Board of Managers to consider the feasibility of appointing at least 1 colored man, a communicant of the Church, on the commission." The following resolutions also were adopted:

That all women hereafter receiving appointment under the Board of Missions shall be required to have at least six months' training in one of our Church training schools or some kindred institution, unless the Board of Managers or the bishop to whose jurisdiction she is to be sent has personal knowledge of her fitness.

That every parish and mission of this Church is expected to contribute to the treasury of our Missionary Society annually for the next three years.

That every parish and mission which has contributed during the past year is expected to contribute annually during the next three years a sum at least one fourth larger than it gave last year.

That the Board of Missions requests the House of Bishops to commit to a special committee of its own number, to report to the next General Convention, the question of redistricting the whole of our domestic missionary territory.

The last resolution was the result of an expression of opinion by the Committee on the Reports of the Boards of Managers.

From the report of the Board of Managers the following is taken:

With regard to educational subsidies, the board has within the past year adopted the following resolution:

That in the judgment of this board it is inconsistent with the position taken by the Board of Missions in 1892 in regard to Government appropriations, for any school occupying a building or buildings owned by this Church to receive grants of money from the United States.

The gross receipts of the society for the fiscal year, including those for specials and for miscellaneous purposes, amounted to \$727,284.09. The contributions for the work of the society were \$443,813.23. Compared with the previous year, there was an increase of offerings for general missions of \$65,486.56, an increase of offerings for foreign missions of \$9,311.55, and a decrease for domestic missions of \$1,158.93. The amount received from legacies, exclusive of items for investment, was \$59,262.59. The total amount at the discretion of the board toward meeting its appropriations was \$503,075.62. In addition to this, legacies amounting to \$11,000 were received for investment. The amount received for specials (which do not help the board in meeting its appropriations) was \$44,413.45.

The number of parishes and missions on the board's books is 5,484; and of these, 3,506 (432 more than in any previous year) contributed to the work of the society during the fiscal year. The Lenten offering from Sunday schools,

amounting to \$67,471.91, was made by 2,328 schools, or 238 more than last year, the increase in offerings being \$9,361.

On account of domestic missions, the society paid out during the fiscal year \$138,791.17; Indian missions, \$49,285.02; colored missions, \$57,514.46; total, \$345,590.65. For foreign missions \$173,181.94 were paid out. The cost of administration and collection was \$28,158.43; of printing, \$14,374.18. The cash on hand Sept. 1, 1895, was \$68,251.16.

The trust funds of the society amount to \$906,950.55 at par value, or \$910,328.55 at market value. The income collected from these was \$29,901.44. The Missionary Board's fund amounts to \$167,506.08.

The Convention, in 1895, adopted this resolution:

That the Board of Managers is hereby directed to use so much of the Board's fund as it may deem necessary, and to employ such agency as it may think best for the establishment or expansion as may be, at such place as it may select, of a school for the education and evangelization of the colored people.

For domestic missions the receipts were as follows: Balance in treasury Sept. 1, 1894, \$37,504.96; cash received during year (including \$22,620.16 for Indian missions and \$13,791.54 for colored missions), \$151,042.09; half of the general offerings to the society, \$22,142.44; legacies to domestic missions, \$4,243.17; legacies for investment, \$5,500; specials, \$44,413.45; half of personal loan, \$22,500; total receipts, \$397,349.71. Expenditures in 18 missionary jurisdictions and 37 dioceses (including \$48,255.01 for Indian missions and \$27,514.46 for colored missions) were \$344,546.65; specials, \$42,367.42; interest (half), \$421.15; half cost of administration and collection, \$13,079.21; half cost of printing "Spirit of Missions" reports, etc., \$1,397.15; legacies deposited for investment, etc., \$5,650; returned to Trust fund, \$18,000; return of personal loan (half), \$22,500; balance Sept. 1, 1895, for domestic missions and specials, \$42,008.12; total, \$397,349.71.

The whole number of missionaries, clerical and lay, receiving salaries or stipends during the year was 837 (a decrease since last year of 9), and the amount appropriated for the whole work was \$269,635.

The Commission on Work among the Colored People reports the number of colored clergy as 73, an increase of 7 since last year. Of these, 64 are in priests' orders, and 14 are employed in Northern cities. The commission has confined its grants to the 16 Southern or old slave States—now divided into 25 dioceses and missionary jurisdictions—containing a population of more than 7,000,000 of persons of African descent. Last year the amount received in all was \$107,158.05, and the expenditures \$53,591.46. The returns, as far as they can be obtained, show that there are at least 1300 churches and mission stations, with 6,710 communicants, in charge of about 121 clergy, of whom more than 60 are white.

Of the 5,284 parishes and missions of the Church, 2,250 contributed to foreign missions, 613 more than last year, the amount given being by far the largest in any year. The financial condition for 1894-95 is reported as follows:

Balance Sept. 1, 1894, \$28,290.60; cash received during the year, \$108,483.66; half the general offering to the society, \$92,143.44; legacies, \$13,485.45; undesignated legacies applied to foreign missions, \$10,893.72; specials for Africa, China, Japan, etc., \$38,985.18; legacies for investment, \$5,500; withdrawn for time being from trust funds, \$21,189.48; half personal loan, \$32,500; total, \$351,471.53. Expenditures on account of missions, \$173,181.94; specials for Africa, China, Japan, etc., \$34,167.91; interest (one half), \$421.14; half cost of administration and collection, \$13,079.21; half cost of printing "Spirit of Missions," reports, etc., \$7,187.13; legacies for investment, \$5,650; return to trust funds, \$32,189.48; half personal loan, \$32,500; balance Sept. 1, 1895, for foreign missions and specials, \$53,094.69; total, \$351,471.53.

The Missionary Bishop of Cape Palmas reports that because of territory having been ceded to the French, as was mentioned last year, 35 of the principal stations and preaching places of the mission have been lost, leaving 63 stations and substations under the care of the 16 clergy connected with the Western Africa Mission, the number of communicants being 1,241, and of Sunday-school pupils 1,450.

In Japan the repairs to buildings damaged by the earthquake last year have been finished, and the construction of the Tokio hospital, St. Paul's College, and other institutions is progressing. In his report the bishop says:

One result of the war between Japan and China has been a kindlier feeling toward Christianity, a lessening of the suspicion that a Japanese can not be at the same time a good Christian and loyal to his Emperor. A way has been opened which gives us new opportunities for knowing and influencing the Japanese soldiery. The ministers of war have given every encouragement and assistance to missionaries and other Christian workers to preach and distribute Bibles and tracts to the garrisons throughout the empire. Six native Christians received official permission to go with the army as chaplains and "comforters." This permission was sought by and refused to Japanese Shinto priests.

The principal events of the year in China are the printing of a Chinese Church hymnal, the conclusion of the first portion of the revision of the Prayer Book, and the opening of the new building of St. John's College.

The work of the Church in Hayti was commended by the President of the republic in his last annual message. The formal opening of the Church of the Holy Trinity at Port au Prince took place Aug. 11, the debt upon it having been extinguished.

The Woman's Auxiliary.—At its triennial meeting in Baltimore in 1892 this organization resolved "That the Woman's Auxiliary place before itself, for its united offering at the next triennial, the endowment of the episcopate in a missionary jurisdiction." At the triennial service of the Auxiliary in 1895 an offering of \$55,000 was made, and later it was further resolved "That the Woman's Auxiliary set before itself as its object for the next three years the raising of a still larger sum than that of 1895 as an offering, to be a gift from the Woman's Auxiliary to the Board of Missions, to be used for the train-

ing and support of women workers in the missionary fields."

A summary of the work accomplished by the Auxiliary and its junior department in 52 dioceses and 13 missionary jurisdictions Sept. 1, 1894, to Sept. 1, 1895, shows contributions: Under appropriations for domestic missions, \$22,878.83; for foreign missions, \$23,169.67; specials for domestic missions, \$39,443.22; for foreign missions, \$51,390.30; boxes, 8,312, valued at \$181,571.91; total value of contributions, \$349,215.26, of which amount the junior department contributed \$36,427.23. Within the past three years 7 woman workers have been sent into the mission field by the Woman's Auxiliary as regular missionaries of the board—2 to Africa, 3 to China, and 2 to Alaska. The first Church hospital in the Indian Territory, the first Church hospital in Arizona (for the benefit of the Navajo Indians), and lace schools among the Chippewa Indians of Minnesota have been established.

The American Church Missionary Society, as the foreign field under its charge, has the island of Cuba and the southern division of Brazil. In Cuba the work has been suspended by the civil war. In Brazil there were 62 baptisms during the year and nearly 200 communicants, and the churches in Brazil contributed \$3,281.52, more than one third of the whole amount contributed to the support of missions through the society. The total receipts of the society were \$33,830.48, and the balance Sept. 1, 1895, was \$4,708.73. Its securities amount to \$117,293.05.

The Society for promoting Christianity among the Jews reports an increase of toleration toward its missionaries, but states that Jewish converts are expelled from their homes, deprived of a means of livelihood, and subjected to all manner of personal indignities. Its cash receipts during the year amounted to \$9,744.17; balance from old account, \$1,763.15; total, \$11,507.32. The disbursements were \$10,902.63; balance on hand Sept. 1, 1895, \$604.69.

Building Fund Commission.—On Sept. 1 this fund amounted to \$275,077.70, an increase during the year of \$14,022.82. Gifts, 19 in number, amounting to \$2,500, were made, and 13 other gifts, amounting to \$1,650, were voted. The total amount of gifts paid to September, 1895, is \$7,403.50. Since the last report 15 loans have been paid off and 35 new loans made. The amount that has been once loaned and returned to the fund by 105 churches is \$152,000. The total amount now outstanding on loan is \$175,247.67.

Prayer-book Distribution.—The Prayer-book Distribution Society, whose object is to promote the distribution of the Book of Common Prayer among the people throughout the United States, this year made its first triennial report, from which it appears that since the adoption in 1892 of the revised Prayer Book about 1,000,000 copies of that book have been published and report has been made of the grant of 195,800 copies of the prayer book and 94,488 copies of the hymnal.

Religious Orders.—To the religious orders for men heretofore enumerated has been added the Brotherhood of the Good Shepherd, founded in 1895, whose objects are the same as those of

the Brothers of the Church, and the Community of St. Benedict, founded in New York in 1894 and reorganized in 1895 under the rule of St. Benedict. This community is dependent for support upon voluntary contributions. Its objects are thus set forth:

To aid in revival of three of the special characteristics of the Holy Catholic and Apostolic Church in all ages and lands:

1. Honor and devotion to our blessed Lord in the blessed sacrament of his holy body and blood.

2. Honor and Invocation of the holy mother of God and all saints.

3. Continuous worship of God and intercession for the peace and salvation of souls in ways only possible within the cloister.

The only requirement for admission for priest or layman is the vocation.

The Sisterhood of All Angels, Wilmington, Del., was founded during the year. In the list of diocesan communities should be included the Diocesan Community of St. Martha, Louis-

ville, Ky., organized in 1875 as a sisterhood, and reorganized as a community of diocesan women in 1881, and the Diocesan Community of St. Katharine of the diocese of Georgia, Macon, Ga., organized in 1881.

Miscellaneous.—Four bishops have died during the Church year. These are William Bell White Howe, sixth Bishop of South Carolina; David Buel Knickerbocker, third Bishop of Indiana; Elsie Smith Thomas, second Bishop of Kansas; and Mark Anthony Le Wolfe Howe, first Bishop of Central Pennsylvania. The death of 79 clergymen is also reported. The deposition of 10 presbyters was found necessary, and 2 were restored to the ministry. John Halse White was consecrated Bishop of Indiana, and Frank Remond Brooks Millspaugh Bishop of Kansas. An event of much importance was the completion by the learned and venerable Bishop Schermerhorne of his translation of the Scriptures into the Waili or literary language of China.

Q

QUEBEC, an eastern province of the Dominion of Canada.

Government.—The resignation of Hon. J. S. Hall, provincial Treasurer, on account of the loss of \$5,000,000 which had been placed in Paris during the summer, and, as he claimed, unnecessarily, was a blow to the ministry. The Premier, Hon. L. O. Taillon, assumed the treasuryship himself and appointed M. F. Hackett, of Stanstead, to be President of the Council and A. W. Morris, of Montreal, a member of the Executive without portfolio.

Finances.—The finances of Quebec are not easy to manage, and during the period of extravagance that lasted from 1886 to 1892 the net debt of the province increased from \$6,000,000 to \$15,000,000, and the gross debt from \$19,068,023 to \$28,731,363. In 1894 this gross indebtedness was \$30,215,272. In 1894-'95 the expenditure was \$4,195,727, and the receipts \$4,322,028.

On Nov. 26, 1895, Mr. Taillon delivered the annual budget speech. He stated that for the fiscal year ending June 30 \$187,314 had been obtained from judicial stamps instead of the \$175,000 estimated; the building fund yielded \$29,477 instead of \$10,000; the tax on commercial corporations \$160,736 or \$20,736 more than the estimate; and the tax on successions \$102,525 instead of \$40,000. Those taxes that fell short of the estimate included the Crown Lands Department, \$35,767; license law, \$35,996; manufacturing and trading licenses, \$128,067; transfers of real-estate tax, \$74,129. The expenditure on the public debt had been estimated by his predecessor at \$1,527,296; it was only \$1,486,660, the difference being due to the better credit of the province and consequent lower rates on its maturing loans.

Legislation.—The Legislature was opened at Quebec, Oct. 30, 1895, by Lieut.-Gov. Chapleau in a speech from the throne, of which the following passages are the most important:

My Government has endeavored as much as possible to direct dairy operations, and in order to pre-

vent overstocking of the cheese market has specially favored butter-making, and awarded prizes for co-operation working in winter. The quantity of butter manufactured in winter has more than doubled during the three years that these prizes have been granted. This question of competition in production having been placed on a satisfactory basis, my Government has striven to restore the reputation of butter from the province of Quebec in England, a reputation which has greatly suffered from adulteration made under unfavorable circumstances. The results hitherto obtained have been most satisfactory. Butter from this province is now found in England among the best products of a similar nature of the whole world. The exports of this article, which fell off in 1894, have again increased. The total production of our dairies of the province of Quebec, which did not amount to \$2,000,000 in 1893, reached \$2,000,000 in 1894.

While the progress which is being made in every branch of agriculture is attracting the attention of our sister provinces and of foreign visitors to our province, new regions are being opened to agricultural settlement. The fertile plains of the Montpelier, of Lake St. John, Temiscamingue, and the section north of Montreal are being colonized by settlers from the old provinces, and even from some of the cities of Canada and the United States.

The state of our finances will enable my Government to propose to you the abolition of "the manufacturing and trading license, and the direct taxes on certain persons," but the financial situation cannot be definitely settled until the railway companies now being carried on have been completed or abandoned, nor until the conclusions, arrived at by arbitrators upon the disputed accounts between the Government of Canada and the governments of Quebec and Ontario have been completed in fact.

The Legislature adjourned Jan. 12, 1896. The important measures passed were those:

- Respecting above prejudicial to agriculture.
- Respecting railway taxation.
- To amend the laws respecting public instruction and systems for the insane and the Quebec forest law.
- To establish the Laurentian National Park and the Tremblant Mountain Park.
- To amend "the twelve children act."
- To prevent bribery and corruption in municipal and civil corporations.

To amend the law respecting the subdivision of cadastral lots.

For the protection of forests against fire.

To amend the tariff of tolls on timber and lumber making use of improvements on streams.

To amend the act respecting taxes on subsidies to railways.

Concerning the cultivation of the sugar beet.

Agriculture.—The annual report of the Department of Agriculture shows that in 1893 141,251 pounds of butter, valued at \$31,537, were manufactured; in 1894, 255,868 pounds, valued at \$60,094; in 1895, 562,061 pounds, valued at \$118,013. It also shows that, while the manufacture of cheese in the province in 1890 was only 4,924,504 pounds, it had increased in 1894 to 31,554,746 pounds—a difference in value and revenue to the farmers of \$4,000,000. In 1891 there were 345,789 horses, 970,887 cattle, 722,025 sheep, and 348,397 swine in the province.

Education.—During the year ending June 30, 1894, the Roman Catholic population of the province maintained 4,727 schools, or one school for every 273 persons, and the Protestant population 955 schools, or one to every 206 persons.

There were also 9 schools of arts and manufactures and 6 of agriculture and dairy pursuits. The total number of pupils enrolled in the province was 284,047; the average attendance 214,960. The Roman Catholic schools were attended by 1,291 Protestant pupils, and the Protestant schools by 2,699 Roman Catholics.

The pupils of French origin learning English numbered 48,253, and those of English origin learning French were 18,542. Agriculture was studied in the public schools by 49,245 pupils. The male lay teachers numbered 395, of whom 284 were Catholics and 111 Protestants. The female lay teachers numbered 5,353, of whom 4,224 were Catholics and 1,129 Protestants.

The total expenditure for education in the province was \$2,642,481.

Forests and Timber.—The forest and woodland area of Quebec is 116,521 square miles. The timber cut under license in 1893 was 428,-

598,000 feet of pine saw logs, 257,140,000 feet of (chiefly) spruce saw logs, 1,131,079 cubic feet of square white pine, and smaller quantities of red pine, boom timber, railway ties, etc. The receipts from timber dues was \$645,655, and the ground rents \$153,005.

Fisheries and Shipping.—In 1894 there were 409 men in vessels and 11,672 men in boats engaged in the fisheries of Quebec. Under an act passed by the Dominion Parliament in 1882 a bounty is paid for the encouragement of sea fishing and the building of fishing vessels. It is paid on the basis of \$3 a ton to vessels, \$3 a man to boat fishermen, and \$1 a boat to the owners. The total value of the vessels, boats, nets, traps, smoke and fish houses, piers, and wharves, etc., used in these Quebec fisheries during the year was \$904,811, or an increase of nearly \$200,000 in ten years. The value of the yield was \$2,303,386. The distribution and value of the catch in 1894 was as follows: Salmon, \$165,303; herring, \$206,493; haddock, \$4,207; halibut, \$13,774; sardines, \$7,050; mackerel, \$125,762; cod, \$1,156,077; lobsters, \$163,734; smelts, \$10,108; miscellaneous, \$450,989. The tonnage of Quebec shipping during 1894—in and out—was 2,587,044. Of this, 2,029,777 tons was British, 126,292 Canadian, and 430,975 foreign. The tonnage of the coasting trade was 5,681,961, compared with 4,433,307 tons in 1893.

During 1894 the imports of Quebec were valued at \$34,175,559, paying a Dominion duty of \$7,723,380, and \$24,555,510 free of duty. It must be remembered that Quebec contains the principal port of entrance to Canada via the St. Lawrence and receives the bulk of British goods, just as Ontario does of American goods. According to the trade and navigation returns, 81,086 head of cattle were exported from Quebec in 1894, but 90 per cent. of these were actually from Ontario. On June 30, 1894, there were 3,024 miles of railway in Quebec, 6 lines centering in Quebec city and 7 in Montreal. The population of the province is 1,500,000, of whom 1,290,000 are Roman Catholics.

R

REFORMED CHURCHES. I. Reformed Church in America.—The Committee on the State of Religion reported to the General Synod statistics of this Church, of which the following is a summary: Number of churches, 618; of ministers, 652; of candidates, 9; of families, 55,934; of communicants, 103,316; of baptized noncommunicants, 41,549; of catechumens, 37,291; of members received during the year on confession, 5,828; of baptisms during the year, 3,837 of infants and 1,389 of adults; of Sunday schools, 892, with 116,389 enrolled members; amount of contributions for denominational purposes, \$187,234; for congregational purposes, \$1,028,366; for other purposes, \$124,063. The number in communion is 2,508 larger than in 1894, while the amounts of contributions are less. The Widows' fund was reported in a satisfactory condition. Annuitants had been paid during the year \$8,250.

The Committee on Publication reported that the board was free from liabilities, and that the receipts from 144 churches—all that had contributed—amounted to \$1,739. The churches were requested by the General Synod to contribute to the board.

A continued shrinkage in the balance of the Disabled Ministers' fund was reported.

The treasurer of the Board of Home Missions reported to the General Synod that the whole amount of gifts, legacies, and interests was \$77,956. The total of offerings from the living to the Missionary fund had been \$58,154. During the year 202 churches and 134 missionary pastors had been aided. These churches and missions included 8,309 families, 12,456 members, and 16,012 members of Sunday schools, and returned 1,212 members added during the year on confession. A mission among the North American Indians in the Indian Territory had been

undertaken by the Women's Executive Committee. The same committee had raised \$16,583 for the purposes of home-mission work, and had helped build 4 churches, repair 6, build 9 parsonages, and had paid the salaries of 3 classical missionaries in the West and of 10 students during the summer months.

The year's receipts of the Woman's Board of Foreign Missions had been \$29,717, and for the twenty years of the board's existence \$286,210.

The General Synod met in its eighty-ninth annual session at Grand Rapids, Mich., June 5. The Rev. Peter Stryker, D. D., of New York, was chosen president. The report of the Committee on the State of Religion showed that in the eleven years since the General Synod had met before at Grand Rapids there had been a marked advance in nearly every respect; it was illustrated by a gain of 98 churches, 103 ministers, 10,536 families, 176 Sunday schools, 26,061 members of Sunday schools, and of \$94,574 in contributions for religious and benevolent purposes and \$90,176 in those for congregational purposes. These gains were nearly equivalent to 10 per cent. in the number of churches and of ministers, more than 26 per cent. in communicants, and nearly 43 per cent. in benevolent contributions. The Committee on Overtures reported that of the proposed amendments to the constitution sent down to the classes, those relating to the election of professors and to the calling of extraordinary meetings of the General Synod had been approved, the latter unanimously. These were declared adopted. The proposed amendments relating to the ecclesiastical standing of professors and the declarative action of the General Synod had been disapproved by the majority of the classes, and were therefore defeated. Twenty-three classes had voted in favor of the proposed plan of federation, and 10 classes, comprising the Holland classes, against it. The plan was declared adopted. A question had risen in the previous General Synod concerning the use of a certain series of Sunday-school-lesson-helps, and the subject was referred to a special committee. Upon the report of this committee the Synod recommended the use of the "International Series of Sunday-school Lessons," and expressed its judgment that "no series of lessons or lesson helps should be introduced or used in which it is not distinctly taught according to the historic faith of the Reformed Church (Conf., Art. V) that the Scriptures are wholly true and the veritable word of God." The scope of the standing Committee on Sunday Schools was so enlarged as to give them authority to review from time to time such publications as may be designed for the use of the Sunday schools with the intent of advising against such as may seem dangerous in their tendency. Sympathy was expressed with the aims of the Franco-American Committee of Evangelization; it was recommended to the support of the people; and the celebration of the two hundred and tenth anniversary of the revocation of the edict of Nantes on the third Sunday of October, 1895, was mentioned as affording a suitable opportunity for an offering in aid of the Huguenot churches. A number of overtures having been received asking amendments to the constitution relating to the eccle-

siastical standing of theological professors, the Synod resolved to defer the whole subject until the Church can be more in harmony as to the method of effecting such changes as are desired. The objects and purposes of the Christian Endeavor League were commended to all the young people's societies of the Church, and grateful acknowledgment was made of the assistance rendered by the Christian Endeavor Societies in building 4 Christian Endeavor churches.

II. Reformed Church in the United States.—The statistical returns of this Church for 1895 give it 953 ministers, 224,441 church members, 191,992 communicants, and 1,656 Sunday schools, with 172,308 pupils. The number of confirmations was 11,881, an increase of 562 from the previous year; amount of benevolent contributions, \$205,224 (decrease, about \$30,000); amount contributed for congregational purposes, \$1,031,983. The Board of Home Missions has enlarged its missions among the Hungarians in the United States, having brought 2 missionaries from Hungary and licensed a third. The board was embarrassed by a debt of between \$5,000 and \$10,000. The receipts of the Board of Foreign Missions were \$20,659. The mission at Sendai, in northern Japan, returned about 2,000 communicants. An effort was making to obtain \$25,000 for the erection of college buildings at Sendai.

III. Christian Reformed Church in America.—This Church is composed chiefly of recent immigrants from the Netherlands. According to its yearbook for 1895, it contains 122 congregations, with 16,637 members and 76 pastors. It has a theological seminary at Grand Rapids, Mich., in which preparatory and theological instruction are given, and with which are connected 3 professors and 2 assistants, with 20 theological and 27 preparatory students. Several pastors were brought over from the Netherlands during the year. Negotiations with the United Presbyterian Church with a view to union have been carried to the extent that an agreement has been made to co-operate in the work of foreign missions. Difference in language is mentioned as presenting a serious obstacle to complete organic union.

REORGANIZED CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS. The forty-third annual conference of this sect (see "Annual Cyclopaedia" for 1895, page 666), was held in Independence, Mo., April 4. Among those present were Joseph Smith, the prophet and leader of the sect, and Mrs. Catherine Salicrú, a sister of Joseph Smith, "the Nauvoo Seer." Reports showed that the Church had purchased a gospel boat for service on the Pacific coast and to bear missionaries to and from the Sandwich and Society Islands; that the Church had organized 31 new societies, gained 4,012 members, and lost by death and expulsion 222 during the previous year; and that it now had 5,000 elders, priests, and teachers, besides many ordained ministers. President Smith decided a question that has been argued by the Church for several years, declaring that adultery is the only cause for divorce, and that therefore all members of the Church must live up to this decision. After the conference, a number of the delegates, headed by J. E. Julian, of San Francisco, began

searching for a suitable location in Missouri for a colony of Mormons to be gathered in California, Arizona, and Utah. The promoters believe that the time prophesied for the gathering together of Zion has come, and they declare that the colony will in part carry out the plan outlined in the revelation of 1830 for the order of Enoch, and erect factories and shops for the employment of those among them who are mechanics.

REUNION OF CHRISTENDOM. The Grindelwald Conference for the Promotion of the Reunion of Christendom opened for 1895 at Grindelwald, Switzerland, Sept. 1. The opening address of the president, Dr. H. S. Lunn, contained a retrospect of the work done and the results achieved by the 3 reunion conferences that had already been held. The general service of prayer for reunion held on Whitsunday in response to the appeals of the conference and the co-operation of many churches in it and movements for union among British and Australian Methodist Churches and among Scottish Presbyterian Churches were cited as evidences of progress. The principal discussions of the conference touched upon questions of union between Anglicans and nonconformists in England, the attitude of the Holy See toward reunion, and the possibility of an educational concordat (concerning religious instruction in state schools). An address was adopted in answer to the letter on reunion which the Pope had addressed to the English people. In this letter the Pope, after referring to the early history of the Church in England and the subsequent relations of that country to the Holy See, had remarked with gratification on the attention given there to social questions, in the shape of movements for the benefit of the working classes, in behalf of religious instruction, temperance, social purity, the defense of religion against rationalism and materialism, various forms of charity, the strict public observance of Sunday, and the general spirit of respect to the Scriptures; recognized the influence of the British nation as a civilizing agency and champion of liberty; and emphasized the power of prayer as supplying the most direct and efficient means of leading to the unity desired. The address in reply of the conference avowed the persuasion that "our Lord Jesus Christ himself is the only possible center of Christian unity, and that the indwelling Spirit of the Father and of the Son in every Christian heart not only constitutes a spiritual unity which man can neither create nor destroy, but furnishes the conditions of that manifested unity for which our blessed Lord prayed"; and the belief "that unity must be obtained not by the absorption of Christians in any one communion of the divided Catholic Church, but by such a union as will conserve all the elements of Christian truth and practice which in the providence of God the various Christian communions have severally exhibited and defended." The president of the conference was commissioned to present this address to the Pope. He visited Rome, but was not received. The Pope expressed a willingness to receive him in a private capacity, but not as the president of a religious body outside of the Church. The Pope having addressed an encyclical to the Eastern Churches on the subject

of reunion, the Patriarch and Holy Synod of Constantinople answered it in an address to the Eastern Churches. The address consists of 25 clauses, in which the position of the Eastern Orthodox Church with respect to the Pope and Church of Rome is set forth. Having shown the impossibility of accepting the Pope's invitation to reunion, the address proceeds:

And as regards the sacred object of reunion, the Eastern Orthodox and Catholic Church of Christ is ready, if perchance she have allowed anything to be perverted or lost, to accept everything which the Eastern and Western Churches held in common before the ninth century; and if the Western Church can prove from the teachings of the holy fathers or the divinely assembled oecumenical councils, that the Roman Church, then orthodox in the West, ever before the ninth century read the Creed with the additional (*filioque*), or used unleavened bread, or that it accepted the teaching regarding purgatory, sprinkling instead of immersion, the immaculate conception of the Ever-Virgin, the temporal power, or the infallibility, or the absolute rule of the Bishop of Rome, we have nothing to say; but if, on the contrary, it be clearly shown, as even the lovers of truth among the Latins admit, that the Eastern Catholic and Orthodox Church of Christ holds the primitive traditional doctrines then commonly acknowledged both in the East and the West, and that the Western Church corrupted them by various innovations, it is then evident to children that the more natural way toward reunion is the return of the Western Church to the primitive, dogmatic, and administrative condition, seeing that the faith is in no way changed by time or circumstances, but remains always and everywhere the same, that there is "one body and one spirit, even as ye are called in one hope of your calling; one Lord, one faith, one baptism, one God and Father of all, who is above all and through all and in you all."

RHODE ISLAND, a New England State, one of the original thirteen, ratified the Constitution May 29, 1790; area, 1,250 square miles. The population, according to each decennial census, was 68,825 in 1790; 69,122 in 1800; 76,931 in 1810; 83,015 in 1820; 97,199 in 1830; 108,830 in 1840; 147,545 in 1850; 174,620 in 1860; 217,353 in 1870; 276,531 in 1880; and 345,506 in 1890. By the State census of 1895 it was 384,758. Capitals, Newport and Providence.

Government.—The following were the State officers during the year: Governor, D. Russell Brown, succeeded in May by Charles W. Lippitt; Lieutenant Governor, Edwin R. Allen; Secretary of State, Charles P. Bennett; Attorney-General, Edward C. Dubois; General Treasurer, Samuel Clark; Adjutant General, Elisha Dyer, succeeded at his resignation, in February, by Frederick M. Sackett; Auditor, A. C. Landers; Superintendent of Education, T. B. Stockwell; Commissioner of Roads, Charles F. Chase; Shellfish Commissioners, J. M. Wright, Benj. Brown, J. C. Church, J. T. Northrup, E. F. Dyer; Railroad Commissioner, E. G. Freeman; Chief Justice of the Supreme Court, Charles Matteson; Associate Justices, John H. Stines, Pardon E. Tillinghast, George A. Wilbur, Horatio Rogers, W. W. Douglas, all Republicans.

The State Census.—The population of Providence is 145,472; of Pawtucket, 32,577; of Newport, 21,537; of Warwick, 21,168; of Woonsocket, 24,468; of Central Falls, 15,828; of Johnston, 11,203; of Cranston, 10,575; of East Providence, 10,170.

The following table shows the distribution and increase of population according to the census of 1895:

COUNTIES.	TOTAL POPULATION.	
	1885.	1895.
Providence	11,340	12,224
East	21,614	26,000
Westport	24,240	26,572
Providence	230,606	266,776
Washington	22,444	24,796
State	261,294	284,756

The number of male adults in the State is 112,900; of these the possible voters number 86,509; the qualified voters, 69,770; and those that voted in April, 43,763.

The adoption of the Bourn amendment to the Constitution has caused a great increase in the number of naturalized voters. In 1885 there were 4,824; in 1889, 12,908; and in 1895, 24,613. The number of aliens in 1895 was 23,204. The percentage of foreign male adults in 1885 was 37-23 of the whole population; in 1890 it was 40-02, and in 1895 it had increased to 42-29.

State Institutions.—The statistics of the Workhouse and House of Correction for the year show that Jan. 1, 1896, there were present 200 men and 76 women; remaining Dec. 31, 1895, 294 men and 63 women. At the Asylum for the Insane the statistics were: Number of inmates Dec. 31, 1894, 310 males, 299 females; committed during the year, 108 males, 91 females; number remaining Dec. 31, 1895, 314 males, 314 females—628.

At the Almshouse Dec. 31, 1894, the number of inmates was 114 men, 126 women, 19 boys, 18 girls; admitted during the year, 142 men, 110 women, 20 boys, 13 girls; remaining Dec. 31, 1895, 137 men, 146 women, 23 boys, 18 girls—629.

The statistics of the State Prison for the year were: Number of men in prison Jan. 1, 1895, 134, women 1—135; committed during the year, 77 men, 1 woman—78; number of inmates Jan. 1, 1896, 153 men, 2 women.

At the Sockanosset School for Boys 196 boys were received and 173 discharged. Dec. 31, 1895, there were 265 boys at the school.

The Oaklawn School for Girls reports 31 girls at the institution Jan. 1, 1895; admitted during the year, 16; number at the school Jan. 1, 1896, 26.

The report of the Rhode Island Hospital for the year ending Sept. 30 shows that the number of patients admitted was 2,046—males, 1,279; females, 767. The number of patients in the hospital Sept. 30, 1894, was 129; Sept. 30, 1895, it was 143.

The total receipts were \$65,862.20 and the expenditures \$69,493.43.

Some changes have been made in Providence in the manner of enforcement of the laws regulating commitments for insanity, which have materially reduced the number of commitments and have also caused controversy between judges and physicians. The law requires that two physicians shall certify to the insanity of the patient who shall be committed by the district judge. It has been customary for the regular physician

of the family interested to certify, together with such other physician as the family may call in; but the court of the Sixth District of Providence issued an order providing that all commitments must be signed by one of three experts appointed by the court, who must also sign the request for a private examination if such should be necessary. As a result, a stop has been put to the practice of committing persons who, while suffering mental peculiarities, could not be called insane. The result of the rule has been that where formerly 3 or 4 were committed every week, only 4 were committed in two months.

Education.—At the one hundred and twenty-seventh commencement of Brown University, in June, about 65 students received the degree of Bachelor of Arts, of whom 7 were women; 30 that of Bachelor of Philosophy, of whom 4 were women; and 4 received the degree of Civil Engineer.

The granite building known as College Hall, at the Rhode Island College of Agriculture and Mechanic Arts, at Kingston, was destroyed by fire Jan. 27. The students received about \$4,000 worth of property belonging to the institution, many leaving their own belongings to burn while they saved those of the State. The Legislature appropriated \$25,000 to rebuild the dormitory.

Insurance.—No life insurance companies are incorporated in Rhode Island. There are 29 companies incorporated in other States doing business there, and the 2-per-cent. tax paid by them in 1894 for business done in 1893 was \$47,991.75.

Industries.—The cotton-goods industry in the State was not in satisfactory condition at the end of the year. The causes are given as follows:

Raw cotton costs almost one third more than it did about a year ago, and there are few mills which are not now using new cotton bought at the advanced prices. Wages are higher, too, and there is practically no demand for goods. A year ago or more very cheap raw material and lower priced labor permitted a profit to the mills at a low range of values on goods.

The advance in the latter has not been sufficient to cover the greatly increased cost of production, and fresh orders for product are coming in.

There was a long-continued strike, involving the operatives of many mills, at Olneyville, beginning in April. There were also strikes at Central Falls, Burrillville, and Westerly.

The Board of Agriculture expended \$20,000 during the year in the prevention of its work, an important part of which is the detection and destruction of infectious animals; of these, 377 were killed, of which 304 were cows and 50 hogs; post-mortem examinations showed that only 12 of these were not infected.

Central Falls.—This village, in the town of Lincoln, has been incorporated as a city, and the municipal government was inaugurated March 18. It is the fifth city in the State, and is very small territorially and very compact, being less than a square mile in extent, with nearly 10,000 inhabitants. Its total valuation is nearly \$2,000,000.

Pawtucket.—The citizens of Attitash, Me., residing in its extreme southwestern corner, have desired to be annexed to Pawtucket for some time, and this year prepared a petition to the

General Court of Massachusetts, asking that the boundary line between the two States be so deflected as to make it pass along the northeastern line of their settlement. A similar petition was prepared to be sent to the Rhode Island Legislature after the first should have been acted upon.

Block Island.—The great Salt pond, Block Island, was formally opened Sept. 21 as a harbor of refuge. The State appropriated \$60,000 for work on the harbor, and the town \$45,000, of which \$70,000 has been expended. The harbor is a natural formation of extensive proportions, and from 25 to 35 feet at low water. A low stretch of sand separates it from the ocean.

New Statehouse.—Ground was broken Sept. 16 for a new Statehouse on Smith's Hill in Providence. The commission to do the work was appointed at the January session of 1893. The city appropriated \$200,000 for a site, provided one were selected within certain limits. The design was made by New York architects, and calls for marble as the material. The contract price for construction is \$1,576,000.

Legislative Session.—The January session began Jan. 29 and ended May 25. Among the more important bills was one called the "Strike act," amending and adding to the chapter "Of Offenses against Private Property," providing fines and imprisonment for willfully obstructing a street railway company in the use of its tracks or willfully and maliciously delaying or obstructing the passing of its cars or carriages thereon, and for willfully and maliciously cutting, destroying, or injuring any machine, appliance, or apparatus used for generating electric currents, or any electric wire or other appliance or apparatus used for the purpose of conducting or transmitting electric currents for using and furnishing power, motive power, light, heat, or used for the purpose of transmitting intelligence, etc.

It was prohibited, under penalty of \$25 to \$100, to "display the flag or emblem of any foreign country on any State, county, city, or town building or public-school house within the State: Provided, however, that when any foreigner shall become the guest of the United States, or of this State, the flag of the country of which such public guest shall be a citizen or subject may be displayed upon public buildings, except public-school houses."

An addition was made to the statutes on birds, forbidding the killing or trapping of carrier pigeons.

A report was received by the Committee on Roads and Public Highways appointed at the January session in 1892. The committee in examining the principal highways of the State found little to commend. In the western part many of the highways traverse very steep hills. A relocation of many of these roads is recommended.

The total number of miles of highways in the State is about 2,420, of which 248 miles are of macadam and 312 of gravel, the rest being common dirt roads. Acts making provision for improvement of the roads and for maintaining and repairing them were passed, and the office of State Superintendent of Highways was created.

The statute on oyster fisheries was amended so as to provide that the Legislature shall elect

5 commissioners of shellfisheries, 1 from each county. The statute on inland fisheries was also amended, and fines imposed for setting traps, weirs, etc., during the close season.

Providence was authorized to borrow \$600,000 for highway work, \$400,000 for school purposes, and \$150,000 for park purposes. A board of canvassers and registration for the city of Providence was created. The Mayor was authorized to contract with the Rhode Island Hospital for the construction and maintenance of a hospital for the cure of contagious diseases. Other acts of the session were:

Providing for a standard form of fire insurance policy.

Regulating the admission of foreign building and loan associations, and providing for reports and supervision of such associations.

Amending the game laws with reference to birds. Requiring signboards at railroad crossings in letters at least 9 inches long—"Railroad Crossing: Stop, Look, and Listen."

An act was passed providing for biennial elections as an amendment to the Constitution, to be submitted to the popular vote if also passed at the May session.

Among the appropriations were the following:

Public schools, \$120,000; Normal School, \$18,000; traveling expenses of students of the Normal School, \$2,000; teachers' institutes, \$500; evening schools, \$5,000; Rhode Island School of Design, including the annual sum provided by the public laws and tuition fees of beneficiaries, \$3,000; purchase of school apparatus, as provided by the public statutes, \$3,000; education of blind and imbecile children, as provided by the public laws, \$12,000; free public libraries, \$5,500; State home and school, \$20,000; support of the indigent insane, \$12,000; State printing, \$30,000; State binding, \$5,000; advertising and publishing public laws, \$10,000; militia and military affairs, \$37,500; armory rents, \$6,700; heating and lighting armories, \$1,750; State library, \$250; law library, \$2,000; State Historical Society, \$1,500; Newport Historical Society, \$500; State Board of Health, \$3,500; State Board of Charities, \$225,000, besides moneys received by them which are appropriated to their use; Society for the Prevention of Cruelty to Children, \$2,500; Prisoners' Aid Association, \$500; State Board of Agriculture, \$15,000; Society for the Prevention of Cruelty to Animals, \$1,000; Soldiers' Relief fund, \$13,000; Soldiers' Home fund, \$22,000; Agricultural College, \$10,000; Institute for the Deaf, \$15,000.

The May session opened at Newport, May 28. The 2 branches were organized, the ballots cast for State officers at the April election were counted, the officers-elect were sworn in, and the new Governor was inaugurated. During the two days of the session the bill for submitting the proposed biennial-elections amendment was passed, additional appropriations were made for the expenses of the State Government, as well as one of \$10,000 for taking the census, \$10,000 for the Board of Agriculture, \$10,000 for use at the armory at Bristol, \$500 for a bounty on wild foxes, and \$10,000 for having the State properly represented at the various expositions to be held in Mexico and other places.

Political.—The Republican State Convention was held in Providence, March 14. The resolutions, after declaring in favor of the party policy on national questions, favored the plan for biennial elections. All the State officers except the Governor were renominated. The new candi-

date for the governorship was Charles Warren Lippitt.

The Democratic Convention met the same day, and confined itself to resolutions on the one State issue as follow:

We pledge ourselves to a constitutional convention as the only way to meet the demands of the people of this State. We denounce the proposed biennial amendment to the Constitution as a partisan fraud upon the people, unfair and designed to perpetuate the present enemies of the people in power, and call upon all to devote their energies to its defeat.

The ticket was as follows: For Governor, George L. Littlefield; Lieutenant Governor, Augustus S. Miller; Secretary of State, George W. Greene; Attorney-General, George T. Brown; General Treasurer, John G. Perry.

Prohibition and Socialist-Labor candidates also were nominated.

At the election in April the Republican ticket was successful, the vote for Governor being as follows: Lippitt, Republican, 25,098; Littlefield, Democrat, 14,289; Quimby, Prohibitionist, 2,624; Boomer, Socialist-Labor, 1,730. The Republicans elected 35 Senators and 67 Representatives: the Democrats, 3 Senators and 5 Representatives. A special election was held Sept. 25 to vote upon the biennial-elections amendment, and the result was its defeat by a vote of 7,449 in favour to 10,603 against.

ROMAN CATHOLIC CHURCH. The reunion of Christendom is the subject uppermost to the mind of Leo XIII, and by way of encouragement to effort in that direction at the outset of 1895 he issued an encyclical which is largely an appeal to Christians to eschew nonessentials and gather in Christ's name in one fold under one pastor.

The great temple to the Blessed Virgin to be erected conjointly by the Catholics of all rites in accordance with the resolution passed at the Eucharistic Congress of Jerusalem—the starting point of the reunion of the Greek and Western Churches—was formally begun during the year, the corner stone being laid at Patra, in Ochala, not far from the place where Christianity formerly flourished under Mary's auspices. Leo XIII gave the first contribution and called for subscriptions from the whole Catholic world to carry out the pledge made by his representatives at the congress.

Later in the year was issued another encyclical, similar in tenor, in which for the separated brethren of the East and West increased devotion was asked of the faithful to the rosary that all creeds, classes, and nations "may be reunited under the beautiful protection of the Blessed Virgin Mary." But the most important pronouncement from the Vatican was probably the apostolic letter issued on April 14, addressed to the English people, who seek the kingdom of Christ in the "unity of the faith, health, and peace in the Lord." In this remarkable document Leo XIII says:

God is our witness how keen is our wish that some effort of ours might tend to assist and further the great work of obtaining the reunion of Christendom; and we tender thanks to God, who has so far prolonged our life, that we may make an endeavor in this direction. But since, as is but right, we place our confidence of a happy issue principally and above

all in the wonderful power of God's grace, we have with full consideration determined to invite all Englishmen who glory in the Christian name, to this same work, and we exhort them to lift up their hearts to God with us, to fix their trust in him and to seek from him the help necessary in such a matter by assiduous diligence in holy prayer.

Then follows a historical summary of the relations between Rome and England and of the love and care of the pontiffs from the days of Gregory. While he was exiled in Belgium, the Pope says, he approved of a society whose object was prayer for the return of England to the fold of Peter, and the thought has ever been with him that the united and boundless applications of so many joined in this holy league must be hastening the time of God's merciful designs toward the English people. The improvement of the condition of the people must indirectly help this forward. "We have heard," he says, "with singular joy of the great attention which is being given in England to the solution of the social question and of the establishment of the benefit and similar societies whereby on a legal basis the condition of the working classes is improved." Thus, the works of charity, the strict public observance of Sunday, and the general spirit of respect for the Holy Scriptures, the innumerable agencies and movements working for the kingdom of God on earth, are all signs of better days, and it but needs prayers whereby human effort is supernaturalized in order to produce vigorous and lasting results." But especially does he urge upon Catholics prayer to the Blessed Virgin, whose aid is asked in the following prayer, which he asked all the faithful to repeat continually:

O Blessed Virgin Mary, Mother of God and our most gentle Queen and Mother, look down in mercy upon England thy "dewy" and upon us all who greatly hope and trust in thee. By thee it was that Jesus our Saviour and our hope was given unto the world; and he has given thee to us that we might hope still more. Plead for us thy children, whom thou didst receive and adopt at the foot of the cross, O sorrowful Mother! intercede for our separated brethren, that with us in the one true faith they may be united to the Supreme High Priest, the Vicar of thy Son. Pray for us all, dear Mother, that by thy fruitful in good works we may all deserve to see and praise God, together with thee, in our heavenly home. Amen.

An answer to this impetuous appeal came in the form of a letter to his Holiness, signed by eminent divines of all denominations in England, followed by a personal visit from Lord Halifax, President of the Anglican Church Union Conference, and a resolution by the same body seconding the Pope's desire.

Leo XIII called Cardinal Vaughan to Rome to consult with him as to practical steps in the indicated direction, but did not find him at all enthusiastic for systematic action. He found in Abbé Duchesne, dictator of the French School of History, Rome, a more valuable ally, that distinguished scholar contending for the validity of Anglican orders, and being supported by Prof. Hecquillon, of the Catholic University, Washington. The Belgian Benedictines opposed the proposition to condemn these opinions, and the Pope ordered silence on the subject. As another evidence of his sympathy, he sent a cordiality to

the "Review Anglais," a new periodical published by French priests in Paris, for free distribution among the ministers of the Anglican Church.

Cardinal Vaughan, in addressing the annual Catholic Conference at Bristol, in September, said the question of corporate reunion of the Churches did not rest upon the validity of Anglican orders, as some supposed. He believed that that subject would be authoritatively decided by Rome in the near future, and he desired it understood that, if it be necessary for the good of religion that the actual archbishop and bishops should efface themselves, gladly would they do so. (See article REUNION OF CHRISTENDOM, in this volume.)

The canonization of Mary Queen of Scots was reported favorably on by the Westminster tribunal in March, and the case was brought to the attention of Rome, the question being simply whether she died a martyr to her faith.

Statistics.—Official tables given out for 1895 by the Propaganda press show the Catholic population of the world to be about 300,000,000, distributed among 1,060 sees. The work of Leo XIII, since his accession to the See of Peter includes the creation and re-erection of 1 patriarchate in the West Indies, 29 archbishoprics, 85 bishoprics, 2 abbots, 59 vicariates, and 2 apostolic delegates, making in all 194 new titles.

The Sacred College was invaded by death during the year, the demise of 10 cardinals, twice the usual number, being reported. In this list were Cardinals Francis Benaïvides y Navarette, of Padua, Archbishop of Saragossa, aged eighty-five; Cardinal Lucien Bonaparte, second cardinal priest in the order of precedence, aged sixty-seven; Julian Florian Desprez, Archbishop of Toulouse, aged eighty-eight; Hamilear Malagola, Archbishop of Fermo, aged fifty-five; Louis Russo-Silla, aged fifty-five; Benedict Saz y Fores, Archbishop of Seville, aged sixty-seven; Cardinal Persico, once Bishop of Savannah, Ga.; and Cardinal Paul Melchers, former Archbishop of Cologne, aged eighty-two.

There were 63 cardinals at the end of the year, including the following 9 elevated at the Consistory of Nov. 29: Adolph Louis Albert Perraud, Bishop of Autun, France, born at Lyons, Feb. 7, 1828; Sylvester Sembratowicz, Archbishop of Lemberg (Greek-Ruthenian rite), born at Dosanico, Oct. 3, 1836; Francis Satolli, Titular Archbishop of Lepanto, Delegate Apostolic to the United States, born at Marsciano, diocese of Perugia, July 31, 1839; John Ottaler, Archbishop of Salzburg, born in St. Martin, Passeyer, diocese of Trient, April 30, 1825; Anthony Maria Cascajares y Azara, Archbishop of Valladolid, Spain, born at Colanda, Saragossa, May 2, 1834; Jerome Maria Gotti, O. C. C., Inter-Nuncios to Brazil, Titular Archbishop of Petra, born at Genoa, March 29, 1834; Achilles Manara, Archbishop of Ancona, born at Bologna, Nov. 29, 1829; Salvador Cassanar y Pages, Bishop of Urgel, Spain, born at Barcelona, Sept. 5, 1834; Johan Peter Boyer, Archbishop of Bourges, France, born at Paray la Moniale, diocese of Autun, July 27, 1829.

Italy and the Papacy.—The celebration, on Sept. 20, of the anniversary of the entrance of Garibaldi into Rome was noted for the univer-

sal protest that it brought from the Catholic world and the speech of Crispi, in which he enthusiastically eulogized the spiritual character of the papacy, but credited its renewed potency in the affairs of nations to the attitude of the Italian Government. The speech was taken at the Vatican as the culmination of the secret negotiations by which it has been sought to bring the Pope into alliance with Humbert in opposition to the internal conspiracies undermining Italy. Catholic participation in parliamentary elections was the immediate end aimed at by Crispi, and following his address came an almost overwhelming pressure on Leo XIII to withdraw his pronouncements against that participation. While the partisans of compromise between the Vatican and Quirinal went about proclaiming the confession of Crispi, the Pope quietly analyzed the situation, and, recognizing under all the intrigue and all the counsel offered him an attack upon Cardinal Rampolla, he wrote a letter to his faithful Secretary of State reiterating his inexorable resolve never to recognize the act by which the papacy was robbed of its temporal rights and independence, and reassuring the vacillating and timid of ultimate victory in the ascendancy of a Rome that will not be a mere capital of a little political state, but a Rome in truth and in entirety the patrimony of St. Peter, the Catholic and international city wherein the whole world shall be represented and heard. In the letter to Cardinal Rampolla, dated Oct. 9, Pope Leo says:

We have been reduced to become almost immediate witnesses of the apotheosis of the Italian revolution and the spoliation of the Holy See. That which most afflicted us is the design to perpetuate rather than to terminate the conflict, of which no one can measure the disastrous effects. The final object of the occupation of Rome was not to complete political unity, but in destroying the walls of the temporal metropolis to attack more closely the spiritual power of the popes. The object was to change the destiny of Rome, return it to paganism, and give birth to a third Rome and a third era of civilization. . . . Nothing will ever confer veritable independence upon the papacy so long as it does not have temporal jurisdiction.

Peter's pence showed the effects of the industrial depression throughout the world, the average of \$1,000,000 yearly being most markedly reduced. France, which furnished three fifths of this, gave evidence of the discontent of a larger portion of the hierarchy, clergy, and people with the papal support of the republic by contributing less than at any time in twenty-five years. There was no change in Pope Leo's policy, however, he refusing to recognize the actions of the Church-hating *colerie* as expression of either the Government's will or that the republic does not fully represent the will of the French nation. In consequence of the revenue losses, measures of economy were decreed at the Vatican. The consulting members of the congregations have been dispensed with, and the salaries of the members themselves considerably reduced.

The Armenian Question.—Mgr. Azarian, the Armenian patriarch resident in Constantinople, in his advices to the Pope, declares that few of the 150,000 Catholic Armenians have taken part in the uprisings of the year, and that

consequently they have not suffered as much as the Sclismatic Catholics and Protestant Christians, although the movement toward Catholic reunion has been somewhat disturbed in consequence. At his Consistory in November, however, the Pope took occasion to refer to the unhappy condition of Armenia and to appeal to Europe in behalf of the whole nation. He contributed 70,000 liras toward the relief of the sufferers by the Turkish barbarities.

Korea.—Persecution of Christians in Korea was reported by Mgr. Mutal, head of the Catholic missions, who declared that 15,000 of his congregation were being hunted like wild beasts, and were compelled to find refuge in the mountains. All the missionaries in the province of Takyong-Tahyeng were compelled to flee to the coast under the protection of French gunboats.

Russia.—A most cordial understanding between the Czar and the Pope was foreshadowed by the visit of Prince Lebanoff to the Vatican, bearing an autograph letter from Nicholas II to Leo XIII at New Year's. On Dec. 30, 1894, the prince and M. Alexander Tswolsky, the new Russian minister to the Holy See (and the first since the breaking of friendly relations between the two courts twenty-eight years ago on account of the persecution in Poland), had a protracted interview with the Holy Father. After presenting the Czar's letter, Prince Lebanoff said he was happy to fulfill an office that enabled him to express his veneration for the Pope and to convey the good will of his Majesty the Czar, whose policy was pacific. The Pope replied that he always supported the principles of order and peace, such as inspired the Czar.

Cardinal Rampolla gave a dinner in honor of the envoy the day following, and later the courtesy was returned by the Russian minister. It was announced that the revocation of the anti-Catholic decrees in the ukase of 1865 was to be permanent. A rupture of these pleasant relations was threatened by the news of fresh outbreaks in Poland in the autumn; but new assurances being received at Rome, the Pope decided to send a cardinal as envoy to represent him at the *fétes* in honor of his coronation in the spring of 1895.

"The Primacy of the Christian Churches" is the title of an encyclical, on which the Holy Father puts in most of his spare time, and which he considers the crowning effort of his work for Christian reunion.

Church and State.—The conflict between Austria and the Vatican continued unabated throughout the year, the Austrian Government insisting upon the recall of Mgr. Agliardi, papal nuncio at Vienna, who sustains the Hungarian hierarchy in their determination to resist the civil marriage laws and other obnoxious measures, and the Pope steadfastly refusing to accede to the Government demand. At the close of the year there were indications of a better feeling, the Pope, in answer to Emperor Joseph's most urgent request, intimating that he might make the recall for good when he creates Mgr. Agliardi a cardinal at the March Consistory.

The Church troubles in Guatemala caused negotiations to be begun by Monsignor Satolli, looking to a resumption of friendly relations.

The papal delegate, in February, addressed the Government, requesting that it, too, like Nicaragua—which has sent Dr. Mariano Barrios as its envoy extraordinary and minister plenipotentiary to the Holy See—send a representative to Rome, and thereby take the readiest means of securing a perfect understanding between Church and state.

The Church and Evolution.—Rev. Dr. Zahm, Professor of Physical Sciences at Notre Dame, Ind., started quite a discussion by his address before the Catholic Summer School, in which he held that there is nothing in Catholic dogma which precludes the view that man is descended from the ape or some other animal, should evidence in its search at last reveal the missing link. He cited St. Thomas to justify Darwin, and St. Gregory in defense of Lapsus.

The Church in America was formally addressed in an encyclical under date of Jan. 6. At the outset the planting of the cross by Columbus at San Salvador is referred to, the papal assistance in the commemoration of that event at Chicago, the Church's concern for the full fruition from a religious point of view of the discoverer's mission, the explorations and services of its missionaries, the achievement of constitutional liberty by the evidence with Catholic aid, the friendships of Archbishop Cermelli and Washington—all these and more were pointed to as evidences that the United States ought to be conjoined in concord and unity with the Catholic Church. The prosperity of the Church is credited "to the equity of the laws which obtain in America and to the customs of the well-ordered republic"; but it is argued that the conclusion must not be drawn that it is the type of the most desirable status of the Church, "so that it would be universally lawful or expedient for state and Church to be, as in America, dissevered and divorced." The two specific objections by which he has endeavored to generate and more safely establish among the American people the Catholic religion, says the Pope, have been (1) the advancement of learning; (2) a perfecting of methods in the management of Church affairs. Speaking of sciences, the document says: "Catholics ought not to be followers, but leaders in the praiseworthy keen competition of talents. This in every age has been the glory of the Church. Upon the enlargement of the boundaries of science has she been wont to bestow all possible labor and energy. . . . We . . . that it should be regarded as the fixed law of the new university to unite erudition and learning with soundness of faith and to induce its students not less with religion than with scientific culture."

The point most dwelt upon is that dealing with the apostolic delegation, in which Monsignor Satolli's power is defined as being to correct errors and make the rough way plain for the faithful; not as an obstacle, but as an aid to the authority of the bishops, who, however, while ruling their own dioceses must not interfere or clash with each other. The indissolubility of marriage, the corruption of morals and of kingdoms through divorce are imposed; and the virtue of temperance, the use of the sacraments as able to the limit of an upright life, the observance of the just laws and insti-

tions of the republic are among the things the clergy are exhorted to inculcate. The industrial workers are warned against violence while seeking to improve their condition, and are admonished to shun the dangerous secret societies condemned by the Church. Catholic journalism is encouraged, but unanimity among journalists and due respect for episcopal authority must be maintained.

The United States.—The summary of the Church's status in the United States at the close of 1895 shows the number of archbishops to be 14; bishops, 69; priests, 10,348; churches with resident priests, 5,853; missions with churches, 3,648; stations and chapels, 5,393; universities, 9; seminaries (secular), 26; students, 1,968; regular seminaries, 82; students, 1,713; high schools for boys, 187; high schools for girls, 633; parishes with schools, 3,361; children attending, 796,348; orphan asylums, 243; orphans, 33,064; charitable institutions, 836; total children in Catholic institutions, 933,944; Catholic population, 9,410,790; Catholic papers and magazines, 249. Death carried off 1 archbishop and 4 bishops, 233 priests, and 170 religious.

Rt. Rev. John M. Farley, Vicar General of New York, in answer to the request of Archbishop Corrigan, was created auxiliary bishop of the diocese on Oct. 9.

The mission built nine years ago by Miss Kate Drexel on Crow Creek Indian Reservation, South Dakota, was destroyed by fire, Oct. 3, several of the Indian children narrowly escaping death.

The resignation of Rt. Rev. Mgr. Denis J. O'Connell as rector of the North American College was supposed to have some bearing upon the ecclesiastical controversies going on in the United States for some years, Mgr. O'Connell being known as a friend of Archbishop Ireland. The elevation of Rev. Dr. Thomas O'Gorman, of the Catholic University, to a bishopric was, on the other hand, quoted as an offset to any supposed significance in the resignation, the latter being the *alter ego* of the archbishop. Mgr. O'Connell was succeeded by Rev. William O'Connell, of the archdiocese of Boston, whose position is announced as that of a strict neutral in all matters affecting ecclesiastical prestige in the United States.

The Catholic Historical Society marked the resting place in St. James's churchyard of Peter Turner, the Catholic pioneer of Brooklyn, by a marble bust erected with notable ceremonies, presided over by Bishop McDonnell and Mayor Schieren.

Bishop McQuaid, of Rochester, incurred the censure of Rome, in January, for his pulpit attack on Archbishop Ireland in December.

The Rev. Dr. Edward McGlynn was formally installed as pastor of St. Mary's Church, Newburg, N. Y., the first Sunday of January; and with the promise of Archbishop Corrigan to give him the first charge equal to old St. Stephen's that may become vacant, one of the most remarkable misunderstandings in American ecclesiastical history closes. Rev. Dr. R. L. Burtzell, counsel for Dr. McGlynn, appealed to Rome from the decision of the archbishop transferring him from a permanent rectorship in the city to an

up-country parish, but it was decided against the priest.

The elevation of Mgr. Satolli to the cardinalate, in November, was taken as the crowning act in the establishment of the Apostolic Delegation at Washington.

The Catholic Temperance Convention held at Carnegie Hall, New York, in August, was a remarkable demonstration in favor of the Sunday-closing movement in that city. It was addressed by Mayor Strong and Police-Commissioner Roosevelt.

Two institutions of learning were dedicated during the year—the McMahon Hall of Philosophy of the Catholic University, in October, and the magnificent theological seminary of St. Paul, the gift to Archbishop Ireland, by James J. Hill, a Protestant admirer, Sept. 4.

The Catholic summer-school idea appears to have taken hold in earnest, not only that at Plattsburg, N. Y., being successful, but two others at Pittsburg, Pa., and Madison, Wis., bidding for favor.

The first Eucharistic Congress held in America was opened in Washington, Oct. 2, by Mgr. Satolli.

The missions to Protestants, by the Rev. Walter Elliott, of the Paulist Fathers, in the West, have proved successful, and a new society in support of them, called the Apostolate of St. Francis de Sales, was approved by Bishop Horstmann, of Cleveland, in October.

Rev. Dr. Fred. C. Rooker, Secretary to Mgr. Satolli, gave the Catholic view of education and religion by request at the centennial commencement of Union College, Schenectady, N. Y., June 23, in the presence of a distinguished assemblage of Protestant ministers.

Great Britain.—The foundation stone of the projected cathedral for Westminster was laid by Cardinal Vaughan June 29. It is on the site of the old Tothill Field's Prison as secured by Cardinal Manning. The edifice will be 350 feet long, 156 feet wide, and 90 feet high, with a 300-foot tower. The Duke of Norfolk subscribed £10,000 toward the work. The cathedral will be placed in charge of the Benedictines.

A vicar apostolic for Wales was appointed in July. He is the Rev. Father Francis Mastyn, of the diocese of Shrewsbury, England, and his new charge covers 12 counties.

Germany.—The third German Catholic Congress at Bingen, Hesse, June 30, was attended by 10,000 persons. Among the resolutions passed were the following:

"The independence of the Pope and the Holy See."
"Free exercise for ecclesiastical power in Home."
"Re-establishment of the religious orders," "Restitution in favor of Catholics by statutory guarantees,"
"Liberty of teaching in schools," "Pacific and Christian solution of the social question," "Development of the Catholic press."

Portugal.—The International Catholic Congress at Lisbon, which began June 13 and continued to the end of the month, was held in commemoration of the seventh centenary of St. Anthony of Padua, and the like of it has not been seen in Portugal since the Middle Ages.

Australia.—Catholic progress here is shown by the new census, which places the Catholic strength as 21-10 per cent. of the population.

Canada.—The Manitoba school question developed into considerable proportions during the year, the Dominion standing by the guarantee of separate schools for Catholics, but Manitoba, on the contrary, voting in the autumn elections, by an overwhelming majority, against it. The controversy still goes forward. The Episcopal Synod of Fredericton, New Brunswick, resolved in June to unite with Catholic and other denominations in a demand for religious teaching in the public schools.

Ireland.—The centennial celebration of St. Patrick's College, Maynooth, June 25, was the occasion of a gathering of Irish priests from every part of the world. It lasted three days. Cardinals Logue and Vaughan participated.

A memorial altar to the illustrious Archbishop Hughes of New York was consecrated Sunday, Jan. 20, in the parish church of his native Omagh, County Tyrone. A movement was started and £700 subscribed in April toward a suitable memorial to Rev. Thomas N. Burke, O. P., the great Dominican preacher, in Galway, where he was born. All Hallows' College, Brinsford, the great missionary college, was almost totally destroyed by fire in May.

The Irish bishops, at their October meeting in Maynooth, issued a pronouncement against the antireligious writings of the Parnellite factional newspapers.

ROUMANIA, a constitutional monarchy in eastern Europe, comprising the former Turkish provinces of Wallachia and Moldavia, which became tributary principalities in 1859 and were united in 1861, declared independent of Turkey in 1877, and erected into a kingdom in 1881. The legislature consists of a Senate, of 120 members, elected for eight years, and a Chamber of Deputies, containing 183 members, elected for four years. Suffrage is in three degrees. The reigning King is Carol I, born April 20, 1839, a prince of Hohenzollern-Sigmaringen who was elected King of Roumania in 1866. The Cabinet in the beginning of 1895 contained the following members: President of the Council and Minister of the Interior, L. Catargi; Minister of Agriculture, Industry, Commerce, and Domains, P. P. Carp; Minister of Foreign Affairs, A. Lahovari; Minister of Finance, M. Germani; Minister of Public Works, C. Olanescu; Minister of Public Instruction and Worship, Take Jonesco; Minister of War, Gen. C. Poenaru; Secretary of the Council, A. Diamandescu. Roumania covers 48,867 square miles and has a population estimated at 3,800,000. The number of births in 1894 was 227,469; of deaths, 176,483; of marriages, 50,825.

Finances.—The revenue for 1894 was 219,597,320 lei, or francs, and the expenditure was 109,361,160 lei. The budget for 1896 makes the total receipts 209,800,000 lei, of which 32,300,000 lei come from direct and 63,410,000 lei from indirect taxes, 48,700,000 lei from state monopolies, 28,436,000 lei from domains, and the remainder from the various departments. Of these revenues the public debt absorbs 73,975,263 lei, 41,016,134 lei are spent on the army, 26,161,920 lei go for public instruction, 21,350,642 lei are allotted to the Interior Department, and 25,650,186 lei are required for financial administration, 5,950,340 for the administration of the domains, 6,318,500 lei for the administration of public

works, 6,025,976 lei for justice, and 1,725,740 lei for diplomacy.

The debt, which was contracted mainly for the purchase of railroads, the transfer of fiscal control to the peasants, and war purposes, amounted in 1895 to the capital sum of 1,975,569,960 lei, bearing monthly 4 or 5 per cent. interest.

The Army.—Military service is obligatory, and, while service with the colors for three years may be required and enough men are drawn by lot to keep up the peace establishment of 47,000 men, all men on leave and the reserves are called out every autumn for the maneuvers, and the territorial troops, who have not served with the colors, are also summoned then and are called out in the spring too for drill and rifle practice. There are 5,020 officers. The active army has 8,200 horses and 266 guns. The territorial army numbers 65,000 men. Roumania possesses a protected cruiser, a school ship, and a river fleet of gunboats and torpedo boats.

Commerce.—The total value of imports in 1894 was 422,142,287 lei; of exports, 294,109,064 lei. The imports of metals and metal manufactures were 104,000,000 lei; of textile manufactures and materials, 143,900,000 lei; of fruits and vegetables, 24,000,000 lei; of hides and leather, 18,000,000 lei. The exports of cereals were 256,000,000 lei in value. Of the imports, 118,374,000 lei came from Germany, 114,065,000 lei from Austria-Hungary, 84,029,000 lei from Great Britain, 34,219,000 lei from France, 22,422,000 lei from Belgium, 21,079,000 lei from Turkey and Bulgaria, 9,125,000 lei from Russia, and lesser amounts from Italy, Switzerland, and Greece. Of the total exports, 96,094,000 lei went to Germany, 78,842,000 lei to Great Britain, 61,808,000 lei to Austria-Hungary, 61,550,000 lei to Belgium, 25,071,000 lei to Turkey and Bulgaria, 10,045,000 to France, and 7,011,000 to Russia.

Communications.—The railroads, all of which belong to the state, have a total length of 1,617 miles, besides which 280 miles are building and 622 miles projected.

The post office in 1894 forwarded 12,242,302 letters, 7,081,397 postal cards, and 11,179,363 printed publications.

The telegraphs have a total length of 4,990 miles, with 9,140 miles of wire. There were 1,400,727 paid domestic messages transmitted in 1894 and 451,657 international and 62,392 transit messages. The expenses of the post office and telegraph service were 7,673,700 lei, while the post office took in 4,974,669 lei and the telegraph bureaus 2,834,932 lei.

European Commission of the Danube.—The International Commission having charge of the navigation of the neutralized parts of the Danube has certain sovereign powers over the river below Braila. Austria-Hungary, France, Germany, Great Britain, Italy, Roumania, Russia, and Turkey have each a representative. The tolls and other receipts in 1894 amounted to 4,673,520 francs and expenses to 4,847,876 francs. The number of vessels that entered the Delta mouth in 1894 was 1,716, of 1,619,200 tons. Of these, 758 were English steamers, of 1,264,087 tons; 122 were Greek steamers, of 180,450 tons, and 118 were Greek sailing vessels, of 82,378 tons; 65 were Turkish steamers, of 48,287 tons, and 232 Turkish sailing vessels, of 87,280 tons.

Austrian steamers numbered 65, of 65,891 tons; and there were 99 French steamers, of 43,347 tons; 37 Russian steamers, of 45,774 tons; 42 German steamers, of 42,537 tons; 26 Norwegian steamers, of 30,880 tons; 18 Italian steamers, of 20,486 tons; and 9 more steamers from Belgium, Spain, and other countries, and 19 French, Austrian, Roumanian, and other sailing vessels. The export of wheat in 1894 was 3,491,000 quarters; of rye, 927,000 quarters; of maize, 4,516,000 quarters; of barley, 2,627,000 quarters.

Politics and Legislation.—The Legislature in the early part of 1895 passed new mining laws. For miners and quarrymen a pension fund and benefit associations were established, to which the men are compelled to give up 5 per cent. of their wages and the mine owners to contribute an equal sum. The Senate passed by a large majority a bill permitting foreigners to conduct mining operations in Roumania, reversing the traditional policy of the Conservative party, which has been opposed to the bestowal of privileges upon foreigners. The Government endeavored to curb the Roumanian agitation in Transylvania, and when a large number of Italian deputies sent a telegram expressing sympathy for the Roumanians who were subjected to Magyarizing measures no notice was taken of it by the Government or the Chamber. The Roumanians in Turkey generally regarded the Macedonian agitation as dangerous to the preservation of their nationality, and the Government took rigorous measures to suppress an attempt of Bulgarian and Russian agitators to gain men and money for the revolution. Two merchants were arrested in Bucharest with arms in their possession, and many foreign agitators were expelled from the country. The Roumanians in Macedonia have much more wealth than the Bulgarians and, next to them, are the most numerous element.

In October the coalition Cabinet was broken up by the resignation of its Junimist members—Carp, Marghiloman, and Germaui. The Premier asked the King to sanction a dissolution, and when this was refused the whole Cabinet resigned. The King sent for Demeter Sturdza, who, on Oct. 15, formed a Liberal Cabinet, composed as follows: Premier Minister and Minister of Foreign Affairs, Demeter Sturdza; Minister of Justice, E. Stasesco; Minister of Public Instruction and Worship, P. Poni; Minister of War, Gen. C. Budisteano; Minister of Finance, Georg C. Cantacuzino; Minister of Agriculture, Industry, Commerce, and Domains, G. D. Pallade; Minister of the Interior, M. Fleva; Minister of Public Works, C. J. Stoicesco. The new Premier declared himself an advocate of the abolition of the oppressive taxation and the improvement of the condition of the peasantry. Elections to the Chamber and Senate were held in December. The Conservative party, which has been dominant since the creation of the country, was almost exterminated. The Government won all the seats except 2 in the Senate and 3 in the Chamber.

RUSSIA. an absolute monarchy in northern Europe, hereditary in the dynasty of Romanoff-Holden-Gottorp in the order of primogeniture. The Emperor, called the Czar, is assisted by a Cabinet of Ministers, each having charge of an

executive department; a Council of State, which examines and passes upon projects of law submitted by the ministers; a Ruling Senate, which superintends the judiciary and watches over the general administration; and a Holy Senate, which directs religious affairs. The reigning Emperor is Nicholas II, born May 6, 1868, who succeeded his father, Alexander III, on Nov. 1, 1894. The ministers who were in office at the beginning of 1895 were: Minister of the Imperial Court and of Domains, Count J. J. Vorontsoff-Dashkoff; Minister of Foreign Affairs, Nicholas de Giers; President of the Council, N. C. de Bunge; Minister of War, Gen. P. S. Vamovsky; Procurator General of the Holy Synod, K. P. Pobedonostzeff; Minister of Education, Count J. D. Delianoff; Minister of Ways of Communication, M. Krivoshein; Minister of Agriculture and Domains, A. S. Yermoloff; Controller General, T. J. Filippoff; Minister of Justice, N. V. Muravieff; Minister of the Interior, J. D. Durnovo; Minister of Marine, Admiral N. M. Telikhatcheff; Minister of Finance, S. J. Witte, D. M. Solsky, M. Ostrovsky, M. de Plehve, and N. J. Stoyanovsky were ministers without portfolios, and the Grand Duke George, heir apparent, and Vladimir, Alexis, and Michael were members of the Council of Ministers. After the death of M. de Bunge, the presidency of the Council was assigned to J. N. Durnovo, who was succeeded as Minister of the Interior by J. L. Goremykin. When M. de Giers died, also in January, Assistant-Minister Shishkin took charge of the Department of Foreign Affairs provisionally until it was committed, on March 19, definitely to Prince Lobanoff-Rostovsky. The Ministry of Ways of Communication was transferred to Prince Khilkoff early in January. Gen. Count Protassoff entered the Council as adjunct to Admiral Telikhatcheff.

Finances.—The budget estimate of ordinary receipts for 1895 was 1,142,957,006 rubles, besides which 2,000,000 rubles of extraordinary receipts were counted upon and 69,421,024 rubles were available from the 3-per-cent. loan of 1891 to balance the expenditures, estimated at 1,214,378,030 rubles, including 94,283,092 rubles of extraordinary expenditure for railroad construction. Of the ordinary receipts, 101,557,788 rubles come from direct taxation; 584,170,741,896 rubles from indirect taxes; 63,582,700 rubles from stamps, etc.; 42,297,106 rubles from mines, posts, and telegraphs; 248,712 rubles from railroads, domains, and other state property; 87,776,325 rubles from repayments of loans to peasants; and 78,442,150 rubles from repayments of other advances and from other sources. Of the ordinary disbursements, 227,417,014 rubles are for the public debt, 2,368,873 rubles for the superior Government bodies, 13,648,893 rubles for the Holy Synod, 11,769,264 rubles for the Ministry of the Court, 4,895,749 rubles for the Ministry of Foreign Affairs, 271,161,313 rubles for the Ministry of War, 54,923,509 rubles for the Ministry of Marine, 144,346,392 rubles for the Ministry of Finance, 31,409,378 rubles for the Ministry of Domains, 86,782,146 rubles for the Ministry of the Interior, 23,600,125 rubles for the Ministry of Public Instruction, 152,745,292 rubles for the Ministry of Roads and Communications, 26,148,870 rubles for the Ministry of

Justice, 5,386,928 rubles for the Controller General, 1,501,192 rubles for the imperial stud, and 12,000,000 rubles for unforeseen expenses.

The extraordinary expenditure of 94,283,092 rubles on railroads includes 49,816,515 rubles for the Siberian Railroad, 2,100,309 rubles for works connected with it, 32,306,268 rubles for other railroads of general utility, and 10,000,000 rubles for local roads of simplified construction.

There was a free balance in the treasury on Jan. 1, 1894, of 259,002,389 rubles. The gold accumulated in the treasury amounted to 247,000,000 rubles. A law was promulgated on May 29, 1895, permitting gold contracts, which have heretofore been forbidden.

The Army.—The empire is divided into 13 military circumscriptions, each of which can put an independent army into the field, 6 in Europe and the Caucasus, and 7 in Asia. The European troops are organized in 22 army corps, each containing 2 divisions of infantry, except the guards and the grenadier corps, which have 3 divisions. The active army of Europe and the Caucasus comprises 48 divisions of infantry, 22 divisions of cavalry, 48 brigades of field artillery, and 44 batteries of horse artillery. Outside the corps formations are 39 squadrons and squadrons of cavalry, 74 battalions of riflemen, 36 batteries and 8 companies of artillery, 7 brigades of engineers, and 5 battalions of train. In 1895 2 new regiments were created in Siberia, and 4 mortar batteries and 22 batteries of light artillery were formed, with 196 pieces. The Berdan rifle of the infantry is being replaced by the repeating rifle of the model of 1891, having a caliber of 7-62 millimetres and a magazine for 5 cartridges. The whole army will have been supplied before the middle of 1896. The Czar sent in August, 1895, to the Prince of Montenegro a cargo of 30,000 of the Berdan rifles, with 15,000,000 cartridges, cannon, machine guns, dynamite, and other war material as a present. The cavalry is armed with the Berdan carbine and the saber, and the men in the front ranks carry lances. The nominal strength of the army is as follows: 17,943 infantry officers and 878,636 men, 3,396 cavalry officers and 100,048 men, 2,505 artillery officers and 85,226 men, and 668 engineer officers and 26,350 men, constituting the field army of 24,512 officers and 1,090,260 men; 14,359 officers and 788,450 men of all arms in the reserve; 2,340 infantry officers and 142,550 men, 1,288 artillery officers and 75,554 men, and 206 engineer officers and 7,396 men, making altogether 3,834 officers and 226,340 men garrisoning the fortresses, and 5,285 officers and 300,412 men in the second reserve. The war footing has been estimated to be 2,532,466 officers and men, with 577,796 horses and 5,264 guns.

The Navy.—The fleet in the Baltic Sea comprises 8 armor-clad turret ships ("Peter Veliky," "Alexander II," "Nicolas I," "Navarin," "Sisoid Veliky," "Sebastopol," "Petropavlovsk," and "Poltava"), of from 8,750 to 12,000 tons displacement and 14 to 18 inches of armor, and armed with 2 or 4 12-inch guns, with a subsidiary armament of 6-inch guns and numerous quick-firing guns; 1 casemated armor-clad ("Gangout"), of 6,628 tons; 2 new monitors; 3 floating batteries; 4 turret ships; 12 old monitors; 8 armored cruisers ("Rurik," "Admiral

Nakhimoff," "Pamiat Azova," "Vladimir Monomach," "Dmitry Donskoi," "Mitsur," "Duke of Edinburgh," and "General Admiral"), of from 4,600 to 10,000 tons, carrying 8-inch, 6-inch, and quick-firing guns, and from 2 to 7 torpedo cruisers; 5 torpedo cruisers; 4 coast-guard gunboats; 10 older gunboats; 2 dark-hulled cruisers; 18 clippers; 2 school ships; 6 yachts; 7 transports; and 28 first-class and 82 second-class torpedo boats. Two large cruisers ("Rurik" and "Bogoya") with triple screws and a powerful armament are nearly completed; also 2 naval coast-defense armor-clads ("Admiral Gromoboy" and "Admiral Senyavin," and "Admiral Apraksin").

The Black Sea fleet consists of 6 armor-clad turret ships ("Catherine II," "Tikhon," "Sisoid," "Twelve Apostles," "Georgy Potemkin," "Tri Sviatitela"), of from 10,000 to 12,000 tons displacement, carrying 4 or 6 12-inch guns, and a full complement of smaller guns, quick-firers, and torpedo cruisers, and protected by from 14 to 16 inches of side armor; 3 circular monitors; 1 cruiser ("Pamiat Marksa"); 3 torpedo cruisers; 12 transports; 2 school ships; 6 gunboats; and 17 first-class and 7 second-class torpedo boats.

In the White Sea there is a fleet consisting of 1 cruiser, 4 gunboats, 4 armed transports, and 15 torpedo boats, and on the Caspian, there are 6 armed vessels.

Commerce and Production.—The mining and manufacturing industries of Russia have increased in rapid progression. The yield of gold, which is found in Siberia and the Ural mountains, was 1,167,452 ounces in 1894. The product of zinc in 1892 was 3,659 tons; of copper, 4,190 tons; of pig iron, 905,000 tons; of coal, 6,800,000 tons. The products of the manufacturing establishments, of which there were 22,669, employing 878,580 hands, were valued in 1891 at 1,349,161,000 rubles. The product of the cotton mills increased from 240,000,000 rubles in 1880 to 487,000,000 in 1893. The product of cast iron increased between 1880 and 1893 from 8,810,000 to 23,800,000 hundredweight; iron, from 5,770,000 to 9,700,000 hundredweight; steel, from 6,000,000 to 9,610,000 hundredweight; rails, from 3,960,000 to 4,440,000 hundredweight; manganese ore, from 200,000 to 4,000,000 hundredweight; coal, from 64,770,000 to 148,000,000 hundredweight; salt, from 15,000,000 to 28,000,000 hundredweight; naphtha, from 4,900,000 to 108,700,000 hundredweight; raw cotton, from 200,000 to 1,225,000 hundredweight; and sugar, from 3,000,000 to 11,470,000 hundredweight. The number of cotton spindles grew from nothing to 6,000,000. The product of the distilleries is declining. In 1894 the Government undertook the business of retailing alcoholic drinks, beginning with the eastern provinces. The trade with Asia is increasing rapidly. Extraordinary efforts are being made to extend Russian trade into Manchuria, Mongolia, and western China.

Railroads.—While new railroads are being constructed by companies by the aid of Government guarantees and loans, the Government is steadily acquiring all the existing lines that remain in private hands. The principal new lines are in northern Russia. A railway that is being built from Khar'kov, on the Volga, to Tschernia, connecting with the Cassian system, is ex-

pected to divert a large part of the grain exports of St. Petersburg to the Black Sea; but the trade of the capital and the prosperity of northern Russia will derive advantages from the important new line from Vologda to Archangel, from one that will furnish an outlet for the products of the Government of Viatka, from one that will run from St. Petersburg to Kemi, in Lapland, and from others that have been begun or are projected. A direct line connecting St. Petersburg with the terminus of the Siberian Railroad is in contemplation.

The entire line of the Siberian Railroad, which is divided into 7 sections, is 7,112 versts, or 4,713 miles. The appropriation made for its construction is 350,210,482 rubles. The work is being pushed from Cheliabinsk and Vladivostok, the termini, and from Irkutsk east and west. The work on the eastern sections, which have been advanced more rapidly than the other parts, was done partly by hired Chinese and Korean laborers and partly by convicts, who receive immunities and pay for their labor. The work of criminals on the middle sections has been satisfactory, but the engineer of the Ussuri section preferred Koreans, and sent back 2,000 convicts that were sent from Saghalien. As there was an expenditure of 15,000,000 rubles beyond the estimate on this section, a commission was appointed to investigate the matter.

Posts and Telegraphs.—The post office in 1893 carried 189,830,000 domestic and 25,006,000 foreign letters, 32,920,000 domestic and 4,597,000 foreign postal cards, 172,663,000 domestic and 18,106,000 foreign newspapers and circulars, and 15,225,000 domestic money letters with a declared value of 15,281,607,000 francs. The receipts of the post office were 94,107,432, and of the telegraph service 47,724,832 francs, while the expenses of both services were 98,351,448 francs.

The telegraphs had in 1893 a total length of 78,416 miles, with 154,762 miles of wire. The number of internal messages was 10,603,020, and of foreign messages 796,111 were sent and 826,011 received.

Finland.—The Grand Duchy of Finland has a Legislature in which the 4 estates of the nobility, the clergy, the burghers, and the peasants are represented. Gen. Count Heyden is the Governor General and Commander in chief of the troops of the circumscription of Finland. The population consists of 2,112,000 Finns, 332,000 Swedes, 6,700 Russians, 1,750 Germans, and 1,140 Lapps. The number of marriages in 1893 was 14,095; of births, 75,150; of deaths, 53,122. The revenue for 1895 is estimated at 67,635,174 marks or francs, and expenditure at the same figure. The public debt is 73,180,430 marks. The imports in 1894 were valued at 128,700,000 marks, and exports at 136,000,000.

Politics and Legislation.—The new Czar made it clear at the outset that he did not intend to alter the internal policy instituted by his father. Although Gen. Gourko was relieved from the governor generalship of Poland and was replaced by a diplomatist (Count Shuvaloff), the Czar made the retiring Governor General a field marshal, and publicly thanked him for what he had accomplished by his rough meth-

ods in the way of making Poland Russian and orthodox. The removal of the Jews from their homes outside the pale was renewed after an intermission, and the emigration movement thus received a fresh stimulus. Orders were issued closing the health resorts and mineral springs of Russia and the Caucasus to Hebrew invalids. The students of St. Petersburg, Moscow, and other universities wished to petition the Czar to change the obnoxious regulations lately introduced in the higher educational institutions, but were compelled by the authorities to desist. The police brutally mishandled some riotous students in St. Petersburg; and later some of the police officials sought to gain credit by making many arrests of supposed Nihilists and reviving the political prosecutions. When representatives of Zemstvos waited upon the Czar expecting a declaration of his sentiments regarding the mooted question of local self-government, he expressed himself to the delegations on Jan. 29 in a way that disappointed the advocates of constitutionalism:

I am pleased to see here the representatives of all classes assembled to express their feelings of loyalty. I believe in the sincerity of these sentiments, which have always been characteristic of every Russian. But I am aware that in certain meetings of the Zemstvo voices have lately been raised by persons carried away by absurd illusions about the participation of the Zemstvo representatives in matters of internal government. Let all know that, in devoting all my strength to the welfare of the people, I intend to protect the principle of autocracy as firmly and unswervingly as did my late and never-to-be-forgotten father.

The Government control over the commercial, industrial, and social activities of the country is extending. The peasantry are being assisted in new ways, and the financial affairs of the nobility are being taken under the supervision of the Government. The pawnshops have been brought under Government direction, as well as the drink traffic. New banking laws empower Government officials to dictate to banks regarding the management of their affairs and the loaning of their funds. Stringent regulations have also been imposed upon the operations of stock speculators and all the transactions of the bourse. The laws of factory inspection and regulation, already very strict, have been thoroughly revised.

A new penal code, on which experts have been at work since 1881, was completed in 1895. The commission collated all the penal laws of the empire and those of the most enlightened countries, and studied the theories of scientific penology; and, after preparing a general outline of their scheme, submitted it to expert jurists of various countries for criticism. The first result of the commission's work was the enactment of laws in 1884 and 1885 for suppressing work-houses and houses of reclusion. Corporal punishment in prisons was abrogated, and at the suggestion of the commission laws were enacted against usury and the fraudulent acts of officials.

A commercial treaty was concluded with Greece; and on June 11 one between Russia and Japan was signed at St. Petersburg, similar in its provisions to those already made by Japan with Great Britain, the United States, and Italy.

S

SALVADOR, a republic of Central America. The legislative power is vested in a single Chamber of 42 members, elected for each annual session by direct universal suffrage. The President is elected by universal suffrage for four years. Gen. Rafael Antonio Gutierrez was proclaimed Provisional President in June, 1894, by the army that expelled Gen. Carlos Ezeta, and was afterward elected for the term beginning March 1, 1891, with Dr. Prudencio Alfaro as Vice-President. The Cabinet was constituted as follows: Foreign Affairs, Justice, and Public Instruction, Dr. Jacinto Castellanos; Interior, Dr. Prudencio Alfaro; Finance and Public Works, Dr. Cornelio Lomus; War and Marine, Ezequiel Perez. The area of Salvador is 8,100 square miles. The population was 803,354 at the end of 1894.

The treasury accounts for 1894 make the revenue \$8,818,000 in silver, of which \$4,004,000 came from import duties, \$902,000 from the export duty on coffee, \$1,978,000 from the impost on land, \$60,000 from stamps, and \$1,868,000 from other sources. The disbursements were \$8,560,000, of which \$2,675,000 were spent by the Minister of War, \$1,138,000 by the Minister of the Interior, \$3,378,000 by the Minister of Finance, \$213,000 by the Minister of Justice, \$187,000 by the Minister of Public Instruction, \$651,000 by the Minister of Public Works, \$75,000 by the Minister of Foreign Affairs, and \$280,000 by the Minister of Public Safety. The internal debt on March 31, 1894, amounted to \$11,000,000, and the external debt to \$254,000.

The imports in 1894 were valued at \$2,171,000, and the exports at \$6,611,000. The exports of coffee amounted to \$5,035,000; indigo, \$1,120,000; tobacco, \$100,000; ores, \$82,000.

There are 54 miles of railroad and 1,803 miles of telegraph wires.

Political Disturbance.—A futile attempt at a counter-revolution was made in 1895 by the followers of Carlos and Antonio Ezeta. On Feb. 1 a conspiracy to proclaim Gen. Antonio Ezeta President was discovered. Col. Delfino Berrios and other leaders were ordered to be shot. Col. Angel Vasquez, the former chief of police, was taken from jail and lynched. Florencio Bustamante, after remaining for some time in Mexico plotting for the return of the Ezetas, afterward went to Nicaragua, where he was arrested by the authorities and escorted on board an American passenger steamer, the "City of Sydney." When this vessel entered the port of La Libertad the Salvadoran authorities demanded the surrender of the refugee, and the captain finally gave him up. In September ex-President Ezeta, who had been collecting arms and carrying on a brisk correspondence with his partisans, left San Francisco for Mexico with the intention of joining his supporters there and entering Salvador to head a revolution. An insurrection was started at Sonsonate, but it was speedily suppressed after a fight in which most of the leaders were killed or captured. Some of the weapons that Ezeta had been taken from him by the Mexican au-

thorities, and when he found that President Gutierrez was informed of his movements and able to hold in check his adherents in Salvador he relinquished his design.

SALVATION ARMY. Attention was called in the twenty-eighth year's report of the Salvation Army for 1895 to the fact that, with an increasing expenditure on foreign and home work, the management expenses of the great headquarters had rather decreased than otherwise; also, that apart from the gifts of the Salvationists themselves, the income of the army in proportion to its responsibilities was "positively insignificant." The general income and expenditure account for 1894 amounted to £28,185; while £18,459 were raised for the Jubilee fund. The army had 11,335 officers, who preached in 22 languages at 4,653 stations or towns, and 56,196 voluntary officials specially selected and appointed to take definite work. Missions in Poland and the scattered populations of Queensland, California, and the Northwest Provinces of Canada were reached by means of mounted outposts. Much work was done for the army and navy in England and India. The operations and accounts of the "Darkest England" scheme were not included in this report.

The Salvation Army in the United States returned in December, 1895: Number of conversions and outcasts, 664; of officers accepted, candidates, and persons employed, 2,000. Besides the 587 corps and 77 outposts, the army had 14 shops, 6 rescue houses, 3 food and shelter depots, 5 outciders' circuits, 30 training garrisons, and 2 labor bureaux. "Slaves work" had been done in the cities of New York, Brooklyn, Boston, Philadelphia, Chicago, Buffalo, and St. Louis. The following summary is made of the work of six months:

Souls saved, 1,180; families visited, 22,911; widows and orphans visited, 41,341; persons sick with no friends and in sadness, 74,082; meetings in saloons etc., 170; garments given, 3,300; children saved for, 3,681; houses visited, 12,505; persons attended meetings, 196,784; children attended meetings, 3,208; prisoners and persons visited, 146. The income produced in halls of the army in the United States for one month was estimated at \$12,000, while the week-night congregations numbered 1,000,000.

SAMOA, a monarchy in the Pacific Ocean, declared independent and ceded by a treaty concluded at the Samoan Conference in Berlin on June 14, 1899, between Germany, Great Britain, and the United States. King Malietoa Laupepa, who had been deposed during the German occupation, was restored on Dec. 18, 1899. The Chief Justice, appointed under the treaty, is Henry C. Ho, of Vermont. The President of the Municipality of Apia and adviser to the King is E. Schmidt. These officials receive salaries of \$6,000 and \$5,000 respectively. The King's allowance is \$120 a month.

The area of the 14 volcanic islands forming the kingdom is 1,700 square miles. The native population numbered 35,565 in 1897. They belong to the Polynesian race, and produce the

Christian religion. There are 450 foreign whites and 800 or 1,000 contract laborers from other islands. The revenue collected from foreigners was 141,919 German marks in 1894, of which 20,913 marks came from direct taxes, 8,857 marks from a tax on buildings, 94,005 marks from import duties, and 18,144 marks from export duties. Of the total, Germans contributed 66 per cent., English 14 per cent., Americans 9 per cent., and other foreigners 11 per cent.

The dutiable imports in 1894 were valued at 1,791,540 marks, of which 912,231 marks were imported by German, 363,055 marks by British, 270,067 marks by American, and 246,187 marks by other houses. The exports amounted to 1,288,545 marks, of which the Germans exported 1,205,093 and the British 83,452 marks. The exports consist of copra, cotton, coffee, and fresh fruits.

The system of government and international control created by the Berlin final act has proved ineffective. The King has never been recognized by the Tumua party, and the people of his own party pay no attention to the edicts issued in his name. The President of the Municipality of Apia has neglected to pay him his allowance, leaving him often without the necessities of life. None of the islanders will pay the poll tax of \$1, and the revenue collected from foreign traders has diminished and trade is falling off because the natives under the lawless conditions that prevail get out less and less copra. Except on the German plantations, production has almost ceased. Arms and ammunition were smuggled in for the rebels from New Zealand. Tamasese and his allies attacked the tribes belonging to the King's party, but before November hostilities were at an end. The commission appointed to investigate the land claims of foreigners found that Germans had legally secured titles to a large part of the best land, but that many of the claims presented by British and Americans were invalid.

SANTO DOMINGO, a republic in the West Indies occupying the eastern part of the island of Hayti. The Congress, a single chamber of 22 members, and the President are elected indirectly for four years. Gen. Ulises Heureaux was re-elected for his third term in 1892.

The treasury receipts in 1894 were \$2,756,929, of which \$2,674,446 were derived from customs. The public debt on Dec. 31, 1894, amounted to £1,905,035 sterling, \$2,058,415 in gold and \$4,790,520 in currency.

The imports in 1894 were valued at \$2,898,653, and the exports at \$5,383,471. The principal exports are coffee, sugar, cacao, rum, tobacco, mahogany, logwood, lancewood, hides, fustic, and honey. The imports are cotton cloth, hardware, crockery, broadstuffs, and provisions.

Diplomatic relations with France were broken off in 1894 in consequence of the seizure by President Heureaux of \$60,000 in a French bank upon which the Government had a claim. The French Government demanded restitution and an apology, also an indemnity for a French citizen who was imprisoned for twenty-two months without trial, and for a French merchant at Samaná, Noel Cacavelli, recently murdered at the instigation, it was alleged, of the Dominican authorities. Santo Domingo proposed to submit

the differences to the arbitration of Spain, but the arrangement was not consummated. In January, 1895, French war ships went to Port au Prince, and thence the admiral telegraphed that unless a settlement was made at once he would proceed to Santo Domingo and seize the customhouse. President Heureaux replied defiantly and prepared for a bombardment. Meanwhile the United States Government intervened, intimating that it could not view with indifference military action against Santo Domingo. Negotiations were resumed, and in the end the Dominican Government agreed to apologize for breaking the seals placed by the French consul on the Banque Dominicaine and to restore the money seized, and refer the dispute with the bank to the arbitration of Spain; to pay Capt. Boimare 1,000,000 francs as compensation for illegal imprisonment; and to pay an indemnity of 225,000 francs to the family of Cacavelli, whose murder had been executed already. The French minister arrived in Santo Domingo with Admiral Fourrier on April 16, and they were received with honors by the President and welcomed by the populace. The dispute between Santo Domingo and Hayti regarding the boundary, which has often given rise to friction and hostile demonstrations, has been referred to the arbitration of the Pope.

An uprising against the Government occurred in the middle of October, at Banica, a town on the frontier of Hayti. President Heureaux promptly dispatched troops, who killed all the rebels, giving no quarter. In other places in the northern and eastern parts of the country where the people were organized for rebellion, numerous arrests were made, and many persons were court-martialed and shot.

SEARCH LIGHT.—The search light is not a modern invention; the principle involved in its construction has been familiar for centuries, though, like the telescope, its exact origin is uncertain. He who first placed a light in the focus of a concave reflector was its inventor. All headlights to locomotives are search lights, though, from the thinness of the material employed in their construction and their liability to change form because of expansion and contraction by heat and cold, and for other reasons, they are very imperfect ones.

Of the four curves that may be cut from a cone—the circle, the ellipse, the parabola, and the hyperbola—the last only will parallelize the rays from a light set at its focus. Until recently all lighthouse illumination was produced by the oil lamp greatly intensified by the Fresnel lens, but the more recent introduction of the electric arc light has wrought a revolution in the science of parabolized lighting, and has given a largely increased penetration through fog. The light thus produced, reflected from a parabolic mirror, has been named the search light, and is the most intense artificial light known, being limited only by the power of the dynamo generating the electricity therefor. At the introduction of the electric search light the rays were parallelized by parabolic reflectors of metal, and later by parabolic lenses, which soon displaced the long-used Fresnel lenses. The Mangin projector, as it was called, stood foremost among search-light projectors for many

years until, owing to its greater efficiency and cheapness, the parabolic glass mirror largely supplanted all other forms of projectors.

An incident ray from the arc light at the axis of the mirror and at its focus is on entering the mirror bent toward the normal and on its exit is turned away from it, so that the parabolic glass reflector gives less chromatic dispersion than the Maugin lens and also subtends a greater solid angle, reflecting all rays within an angle of 145° . For the greatest utilization of the light of the arc the crater on the positive carbon must be in focus and face the mirror.

The search light which attracted so much attention at the Columbian Exposition of 1893 and the Midwinter Fair of California in 1894 is now on Echo Mountain, Los Angeles County, where it commands the extensive San Gabriel valley, and its beam gives a light sufficient for the reading of a newspaper 35 miles distant. Not only this, but its piercing ray, though emanating 35 miles from the Pacific coast, is plainly visible at the island of San Clemente, 105 miles out at sea. How much farther the ray could be seen were it not for the convexity of the earth we can not know. As the construction is essentially the same in all, a description of the Echo Mountain search light, which, except for its greater size and penetrative power, is a counterpart of those used on shipboard, will suffice.

The reflector, made in Paris, is of optical glass, 5 feet in diameter and at the edge $3\frac{1}{4}$ inches thick, though its center is only one sixteenth of an inch thick. Apparently it is free from spherical aberration and reflects the luminous beam sensibly parallel. Its weight is 800 pounds, and it is mounted in a metal ring weighing 750 pounds. The combined weight of mirror, ring, and cover is about 1,600 pounds. The tube, at one end of which this mirror is mounted, is like an immense drum, and its door consists of a metal rim in which are fixed plate-glass strips $\frac{1}{8}$ inch thick and 6 inches wide.

The electric lamp, which slides upon ways attached to the bottom, is 6 feet high and weighs 400 pounds. Its carbons, manufactured especially for it, are brought from France. The upper or positive carbon is $1\frac{1}{4}$ inch in diameter and $22\frac{1}{2}$ inches long, with a $\frac{1}{8}$ -inch core of soft carbon running from end to end through its center. The lower or negative carbon is $1\frac{1}{2}$ inch in diameter, is 15 inches long, and has also a core of soft carbon through its center. The object of this cylinder of soft carbon is, in the positive carbon, to facilitate the formation of the "crater," and in the negative carbon, to prevent that of the "mushroom." The positive carbon is set a little in front of the negative, and thus nearly all the intense light of the incandescent crater is cast upon the mirror. The maximum current at which this lamp operates is 300 amperes, which gives the lamp a luminous intensity of 100,000 candles and the reflected beam a total luminous intensity of 375,000,000 candles. All the devices for adjusting the positions of the carbons and the lamp are brought through the drum to the outside, and are arranged in close proximity to one another at one side, so that all may be manipulated by the operator without moving from his position. The tube may be moved, both in azimuth and

declination, with great ease and rapidity, a necessary qualification in those designed for use in naval warfare. The illustration shows the internal arrangement. Its constructor was E. H. Knowlton, C. E., at the Schuyler Electric Works, Middletown, Conn.

As yet we have no reliable data regarding the utility of the search lights of ships during naval engagements, though against the shocks and strains incident to rough handling they have been tried and found to stand the test.

The larger war ships are equipped with a sufficient number (differing in the series of different nations) of search lights to illuminate the entire circle of the horizon and so detect the approach of torpedo boats.

To diminish the concussion from the firing of the guns, and in order to cover a larger area of water surface, the light should be placed as near the water line as possible. But this position of the search light is not certain to result in the advantage of the vessel using it, as the water line is the most vulnerable point of attack, and, while the beam will reveal objects at a distance of 3 miles, the ship from which it springs may be seen 25 miles away. But its use may, by the introduction of signals, prevent the confounding of friend with foe. And by the opening and closing of a shutter it will be quite possible

to telegraph Morse or cipher messages with important information from vessel to vessel.

Projectors of the following dimensions and powers are now common on our war ships: 30 centimetres diameter, 3,000 candle power; 40 centimetres diameter, 20,000 candle power; 60 centimetres diameter, 35,000 candle power; 90 centimetres diameter, 40,000 candle power.

Several nations, notably the United States and Germany, have made elaborate experiments on the visibility of the search light at sea in clear, cloudy, foggy, and moonlight nights, and have tested different colors. The result obtained by the German committee was that on a clear, moonless night a white light of 1-candle power was visible for 1·4 mile, and 1 mile on a rainy night. The American test showed that in very clear weather a light of 1-candle power could be plainly seen at the distance of 1 nautical mile; 1 of 3-candle power, at 2 miles; 1 of 10-candle power, at 4 miles; 1 of 20-candle power, faintly at 5 miles; while 1 of 33-candle power was seen plainly at that remove. With green light a 106-candle power was visible for only 4 miles. White light was found to be far more penetrating than any tinted light, especially through fog. Experience has demonstrated that no automatic device can take the place of a hand-controlled lamp. With automatic control two great difficulties occur which only hand control may remedy, viz., the shifting of the crater into an unfavorable position and the building up of an obtuse point on the end of the negative carbon, technically called a "mushroom," which the operator breaks off by bringing the carbons together, which no automatic control could do. Even were it possible to do this mechanically, the lengthening of the arc and probable extinction of the light would result. And yet, notwithstanding these objections, the automatic lamp has some advantages.

While, as we have seen this greatest among search lights, the Echo Mountain instrument, has a mirror 5 feet in diameter, those employed in the war ships of Germany have the standard size of 90 centimetres (about 35 inches), with a thickness of $\frac{1}{16}$ inch, the two surfaces being parallel.

Metal reflectors, though as easy to construct as those of glass, are, from their rapid deterioration of luster, especially at sea, of little value. Though heretofore France and Germany have surpassed all other countries in the manufacture of these instruments, yet the success embodied in the greatest of search lights, described in this paper, must attest to the excellence of American work in this line.

SERVIA, a monarchy in southeastern Europe. The legislative body is a single Chamber, called the Skupshtina, consisting of 134 members, elected by direct universal suffrage. The reigning King is Alexander I, born Aug. 14, 1876, who succeeded to the throne abdicated by King Milan, his father, on March 9, 1889, and assumed the royal powers, superseding the Regency by a *coup d'état*, on April 13, 1893. The following ministers were in office at the beginning of 1895: Premier and Minister of the Interior, Nikola Christich; Minister of Foreign Affairs, Milan Bogitshevich; Minister of Public Works, S. Zlatkovich; Minister of Public In-

struction and Worship, L. Klerich; Minister of Justice, M. K. Georgievich; Minister of Agriculture and Commerce, S. Losanich; Minister of Finance, V. K. Petrovich; Minister of War, Gen. M. Pavlovich.

Finances.—The budget for 1895 makes the revenue 63,755,600 dinars, or francs, of which 20,544,600 dinars are derived from direct taxation, 6,000,000 dinars from customs, 4,082,000 dinars from excise, 15,940,000 dinars from monopolies, 2,360,000 dinars from the law courts, 3,479,000 dinars from the post office, telegraphs, etc., 5,500,000 dinars from state railroads, 600,000 dinars from school and sanitation funds, and 5,250,000 dinars from other sources. The expenditures are estimated at 63,623,868 dinars, of which 1,200,000 are the civil list, 21,691,530 dinars the interest on the debt, 120,000 dinars the expenses of the Skupshtina, 158,294 dinars the expenses of the Council of State, 226,800 dinars general expenses, 2,186,699 dinars pensions and subventions, 1,853,266 dinars the appropriation for justice, education, and worship, 1,170,526 dinars for foreign affairs, 2,482,720 dinars for the interior, 6,423,857 dinars for finances, 12,465,000 dinars for war, 4,885,055 dinars for public works, 2,980,666 dinars for agriculture and commerce, 396,571 dinars for the Board of Control, and 1,220,713 dinars for miscellaneous expenses.

The debt on July 1, 1895, amounted to 360,511,600 dinars.

The Army.—The active army in 1894 numbered 900 officers and 16,147 men, with 3,656 horses and 206 field guns. The army is organized in 5 divisions, and in case of mobilization 105,575 men constitute the field army, outside of which are 15,065 fortress artillery, guards, mountain artillery, sappers and miners, etc., and 27,382 depot troops and reserves, 125,516 men in the first ban, and 63,785 in the second ban, bringing up the full war strength to a total of 337,323 men.

Commerce and Production.—The exports of cattle and pigs reach 20,000,000 dinars a year; wheat and Indian corn about the same, and dried prunes in some years half as much. The product being from 20,000 to 40,000 tons. The total value of the imports in 1895 was 34,881,000 dinars, of which 20,529,000 dinars came from Austria-Hungary, 3,592,000 dinars from Great Britain, 2,814,000 dinars from Germany, 2,517,000 dinars from Turkey, 1,447,000 dinars from the United States, 1,183,000 dinars from Roumania, and smaller amounts from Russia, Italy, Switzerland, France, and Belgium. The exports were valued at 46,023,000 dinars, of which 41,116,000 dinars went to Austria-Hungary, 2,814,000 dinars to Germany, 2,517,000 dinars to Turkey, and the rest mostly to neighboring countries.

Communications.—The railroads have a total length of 336 miles. There are 1,916 miles of telegraph lines, with 4,073 miles of wire. The number of dispatches sent in 1894 was 898,533, of which 764,486 were internal, 119,192 international, and 14,857 transit dispatches. The post office carried 10,316,000 internal, 5,459,000 international, and 1,897,000 transit letters and journals. The receipts of the postal and telegraph department were 1,016,454 francs, and expenses 1,312,095 francs.

Politics and Legislation.—On Jan. 12, 1894, Basko Taisich, a Radical peasant leader and Deputy, Dinich Tauschanovich, Radical ex-minister, and three others were condemned to three years' imprisonment for high treason, and ex-Deputy Cechlinatz, who had confessed and made revelations implicating the others, was sentenced for two years. They were convicted of having formed a plot to seize the young King and to place Prince Peter Karageorgovich, the head of the former ruling house, upon the throne.

The Radicals would not accept the forcible suspension of the Constitution of Jan. 2, 1889, and the stringent press laws and other repressive measures of the Christich ministry. They were unshakably opposed, furthermore, to the substitution of a centralized police for the old communal gendarmerie. Gen. Gruich and Pashich, their leaders, were supported by Ristic and many other Liberals, and even by a section of the Progressist party, headed by ex-Premier Prodanatz, in their demand for the convocation of a great Skupshtina for the restoration of the Constitution or its revision in a constitutional manner. They threatened to withdraw to a body from the Skupshtina, which would have been a dangerous form of protest, since 80 per cent. of the voters are adherents of the Radical party, although in the new Skupshtina, elected under the pressure and intimidation of the Belgrade authorities, the Progressists had a majority, and there were a considerable number of neutrals, who were the most obedient of ex-King Milan's followers. As the Radicals had generally kept away from the polls, very few of their candidates were elected. The ministry, in which Liberals held the most important places, had therefore to meet a Chamber in which it was not sure of a majority, although it had selected the members.

The Skupshtina was summoned to an early session on April 22, especially for the purpose of considering an arrangement for the unification of the debt that M. Petrovich had made with the syndicate of Paris, Berlin, and Vienna bankers who have negotiated all the Servian loans. The proposed conversion of 5-per-cent. bonds into a 4-per-cent. loan promised to save the treasury 7,000,000 dinars a year. Nevertheless the Finance Committee condemned, and the Skupshtina rejected the propositions of the bankers to which the Minister of Finance had agreed in Paris in December, 1894. The bargain was to issue to these bankers, at 70, a loan of 98,000,000 dinars, which was to take the place of several smaller loans bearing the higher rate of interest, and originally issued at 75. The syndicate assumed the responsibility of providing for the payment of the coupons for three years. The salt monopoly and newly established monopolies of petroleum, matches, and cigarette paper was the guarantee, the collection of these revenues to be controlled by special representatives of the bondholders. If the agreement was not ratified by the Skupshtina, the Government could not meet its immediate obligations, for the treasury accounts showed a deficit of 5,000,000 dinars, and no other provision had been made for the payment of the July coupons. But the majority of the Skupshtina thought that the

price offered for the new bonds was too low, and objected even more to giving to the syndicate the exclusive privilege of satisfying the whole debt on similar terms, and yet more strongly to the form of the guarantee demanded, viz., a control over the customs and monopolies pledged for the loan, deeming such foreign control to be dangerous and dishonorable for Servia. Some of the Radical politicians raised the cry that the existing obligations were unfair and oppressive, and that the way to balance the budget was to cut down the capital of the debt to the value actually received, which would improve the security to such an extent as to warrant the reduction of interest to the rate paid by the strongest governments. This scheme of repudiation found no favor with responsible statesmen.

When his scheme was voted down, M. Petrovich resigned on May 4, and King Alexander provisionally intrusted the direction of the Ministry of Finance to M. Zolnerovich.

Before the Skupshtina adjourned it confirmed all the laws that were enacted or restored after the *coup d'état* of May 31, 1894. It also voted an annual allowance of 200,000 dinars to ex-King Milan in recognition of his high qualities and great services to the country. One of its first acts had been to revoke the decree of perpetual banishment enacted against both ex-King Milan and Queen Natalie. Milan had paid no attention to the decree, but the Queen mother insisted on having a legal right before visiting her son or taking up her residence again in the capital. She returned on May 16, and was greeted enthusiastically by the populace and welcomed by the parties that had disowned her in her disgrace and misfortune, but she refused to meet the ecclesiastical dignitaries who had sanctioned her divorce, since annulled.

On May 14 Stefan Popovich was appointed Minister of Finance. He entered at once into negotiations with the foreign bankers, after consulting with the leaders of all the parties, and concluded in June a new financial arrangement. As the Progressists would no longer work harmoniously with the Liberal ministry, M. Christich and his colleagues on July 3 tendered their resignations. After M. Stulich had failed in an attempt to form a coalition ministry in which moderate Radicals should co-operate, one was constituted on July 7 of Progressist elements, as follows: Premier and Minister of Foreign Affairs, Stojan Novakovich; Minister of the Interior, Dimitri Marinkovich; Minister of Finance, Stefan Popovich; Minister of War, Gen. Franasovich; Minister of Public Works and Minister of Colonies of Commerce, Michael Tektovich; Minister of Public Instruction, Prof. Ijubazir Koracovich; Minister of Justice, M. Nisich. The first act of the new ministry was to pardon the prisoners who were convicted of treason in January. The Russian Government offered a loan to relieve Servia from her pressing financial difficulties. This the Government accepted, combining it with the conversion scheme. By the new arrangement with the syndicate, the committee charged with the supervision of the monopolies was to consist of representatives of the bondholders and a large contingent of Servian members. The bill was passed by a large majority on July 20.

When the Hungarian Government prohibited the entry of Servian pigs on sanitary grounds the Servians threatened to retaliate by breaking off commercial relations with Austria-Hungary. A modification of the regulation was secured in September, whereby pigs exported to Hungary were subjected to a week's quarantine, and those consigned to Italy were allowed to pass through to their destination.

When the Skupshtina met on Nov. 27 a bill was announced for the reform of the Constitution, with the aim of securing stability. The financial difficulties were surmounted by the aid of the Russian Government, and guarantees were secured for the payment of the interest on the debt and its amortization, and for the conversion and unification of the principal loans.

SLOYD. Since 1872 the study of sloyd in the public schools of Sweden has created intense interest. The sloyd, a system of manual training in wood and metal work, is taught as an optional study in 1,500 schools there to boys of the age of ten to fourteen years. The Nääs system, arranged by Otto Salomon, director of the Nääs Normal College, has been universally adopted. This has been called the sloyd system. Its object is solely educational. The faults of the old method of teaching only theoretical subjects being recognized, the best ideas of the teachers in this field were studied, and a method was formulated which combines hand and head work in the simplest way possible.

In speaking of the sloyd system, it is necessary to avoid confounding the sloyd series of models with the system itself. The two are entirely distinct. A series of models is never more than the outward expression of an idea. Models of almost any kind could be constructed on the principles that underlie those of the Nääs series, and, though very different in form, they might have equal educational advantages, and might even be more applicable in certain instances.

The word sloyd (Swedish, *Slöjd*) is from the Icelandic, and means dexterity or skill. Old Swedish has the adjective *slög* (artistic or skillful). In the Low German dialect the word *Klüttern* has a similar signification. There is in Sweden a distinct class of workmen known as sloyders, whom we would call "jacks-of-all-trades," as they are able to do various kinds of odd jobs about a house. The Swedish word *Slöjd* exists in other languages, but has a more restricted meaning, referring to the educational idea. In English it is synonymous with manual training as distinct from technical and industrial training.

The sloyd has for its first object to give an indirect preparation for life by teaching branches of certain trades and by imparting a general dexterity to the hand. The Swedes set out to accomplish this by teaching the boys in the schools the rudiments of special trades; but they discarded that system some years ago, adopting the present one in its stead. Experience taught them that the boy was not old enough to know what particular trade he should choose. Again, usually only one trade could be taught, and this, of course, did not accomplish the aim with which the instruction was given. It was impossible to teach any one trade thoroughly in the short time that could be devoted

to it at school, and, as a result, many children left the school impressed with the notion that they were competent workmen.

The second object of the sloyd is to develop the mental faculties and, at the same time, to impart positive useful information. It embraces the doctrine that educators and teachers have been preaching for a long time—that of giving a practical direction to mental activity. Man is not only born to think, but also to do. He is a creative animal; he can and must embody his ideas in form.

The third object of the sloyd is to make it a means of intensifying intuitions, thereby giving a clearer insight into the nature of things. As Herbart desired to see instruction more concentrated—all the subjects closely interwoven, the one serving to aid in the comprehension of the other—so the sloyd, in combining the theoretical and practical, by teaching the elements of the arts and sciences and the method of construction and illustration, aims to excite the intuitive faculty.

Sloyd aims to cultivate dexterity in the manipulation of tools. This is considered one of its secondary aims. Too much stress must not be laid upon the use of tools, as the pupil is apt to lose interest in the work if he does not see a full and quick result for his labor. In France, at one time, the children were taught various exercises in the use of tools, and models were not made at all. In the Danish system the making of models is considered of secondary importance. Very few are made, and these only because they necessitate certain useful exercises of the tools. The use of many tools should be taught, but should serve rather as a means than an end to this instruction.

Primarily, sloyd is to be used as a means of formal education—formal, as opposed to material. A material education seeks to impart a definite knowledge of things for their own sake. A formal education seeks chiefly to develop the innate mental powers, and selects and imparts knowledge in order to strengthen character, will power, memory, perception—in short, all those faculties of the mind which at birth are dormant, and which through education become characteristics of the individual.

Sloyd has for its aims, as a means of formal instruction, to instill a love for work in general; to create a respect for rough, honest, bodily labor; to develop self-reliance and independence; to train to habits of order, exactness, cleanliness, and neatness; to teach habits of attention, industry, and perseverance; to promote the development of the physical powers; to train the eye to the sense of form; and to cultivate dexterity of hand. The following are the principles which have served as guides in the choice of the models:

1. All articles of luxury have been excluded.
2. The objects have a practical value; that is, they can be used.
3. The objects can be finished by the pupils themselves without any help.
4. The objects are such that they can be made entirely of wood. This does not mean that the requisite fixings, such as screws, hangers, and hinges, may not be employed, but that the child should not be required to make these things.
5. The work is not to be polished. This refers to

the use of clear varnishes, French polish, etc.; sand-paper may be used. The object is to encourage the children to work well, and not to think too much of the surface appearances.

2. As little material as possible is to be used. The lesson to be enforced is that the value of the model depends not upon the material used, but upon the amount of real work expended upon it.

3. The pupils are to learn to work both in hard and soft wood. It is not wise to have them work too much in the hardest kinds of wood, as it is a great strain upon their physical strength.

4. Turning and carving are to be used as little as possible, although both may be included. Experience has shown that they are not as valuable as the carpenter sloyd. The time for manual work in the public school is of necessity limited, and to teach turning and carving for educational purposes would require as much time as is necessary for the sloyd. Carving in all cases ought to be left for the end of the course.

5. The models must develop the pupils' sense of form and beauty. In order to attain this object, the series should include examples of form, such as spheres, bottles, and other curved objects.

6. The whole series must be arranged so as to teach the pupils the use of all the necessary tools and to know and perform the most important manipulations connected with woodwork. Each model ought to complete the preceding ones and to teach the use of some new tool or some new kind of wood. The models constitute a series only when there is a logical connection between all of them, each one being the supplement as well as the complement of its predecessor.

In the arrangement of the models the following points have been kept in view:

1. The series must progress without break from the easy to the difficult, from the simple to the complex.

2. There must be a refreshing variety both in the exercises and in the models.

3. The first models of the series should be of such a nature that they can be executed quickly. The tools must be such that results will speedily follow, so that the children by degrees will gain sufficient confidence to undertake work requiring more extended time.

4. In making the first models only a small number of tools should be used.

5. The models must follow in a progressive order, so that by means of the preceding work the pupils will have attained the necessary aptitude to make the succeeding without any direct help from the teacher, and, consequently, it will not be more difficult to make one model than another. The making of the 42 previous models should render No. 50 no more difficult than No. 1 was at the outset.

6. The models must be of such a nature that the child is able to make an exact copy, and not only an approximate one.

7. The knife should be used as the fundamental tool. As nearly every child knows how to use the knife, we have hereby a means of enabling the pupil to proceed from the known to the unknown.

8. Rather hard wood should be used for the first models, as it is more difficult to work with the knife upon soft wood.

It is desirable that each pupil have a set of tools and be held responsible for keeping them in good order. A special cupboard should be placed in the room, wherein most of the tools can be put away after school hours. Each tool should be numbered according to the bench to which it belongs. The art of sharpening tools must be taught.

An opinion has prevailed that the tools used in the school should be smaller than those of the trades, and this idea was carried out in Denmark,

as well as in France, until within recent years. But experience shows that children of the age of eleven to fourteen years are quite capable of using full-sized tools, and even manage to work better in consequence thereof, since the weight of the tool frequently assists in the doing of the work, as, for instance, in planing. Furthermore, if small tools are used, the parents and the children are not apt to regard the work as real.

The Nilsen system is not suitable for children under ten years of age. In Sweden the sloyd is taught in the public school to boys of the age of eleven to fourteen years. The amount of time that is devoted to it is from four to six hours a week, or about one hundred and twenty-five hours a year.

It has been found best to extend the duration of each lesson to two hours. Manual work is perhaps best taught in the middle of the morning, as it then serves to break the monotony of book studies, and yet the children are not too tired to take an interest in the exercise.

The teacher is the most important factor in education. The earnest spirit of the teacher working amid poor surroundings will bring about better results than fine premises, external advantages, and expensive apparatus. The teacher must assume a great responsibility, and for this reason artisans who are not teachers should not be employed to give instruction in manual woodwork. The greatest recommendation for the artisan is his superior technical skill. The principle that must not be lost sight of is that this instruction is an educational means, and that only a skillful teacher can properly impart his knowledge and impress it upon the child's mind. It is necessary for the teacher to take a course in manual work and to become sufficiently acquainted with the manipulation of tools to be able not only to understand the method, but also to make the models.

In 1870 the sloyd was first taught in some of the primary schools of Sweden. Secretary of State Carlsson, who at that time was also at the head of the Ecclesiastical Department, took a great interest in this subject, and in 1871 he introduced a bill in the Riksdag suggesting the adoption of a system of manual work for the schools throughout the kingdom. As a direct consequence of his resolution, there appeared on Sept. 11 of that year a royal mandate to the effect that to each school where the sloyd had been taught a yearly stipend of 75 kronor (\$11) should be paid. This was intended to meet the expense of the material to be used. At this time a grant of 1,500 kronor was paid each year to about 200 schools. The number of schools in which the sloyd was taught increased so that 1,278 schools received a subvention in 1890.

In 1876 a private normal sloyd school was established in Karlstad, and in 1877 the Government laid a proposition before the Riksdag to introduce the sloyd in all the public seminaries for teachers. At this time, as well as in 1890 (when the same question was moved by individual members), the Riksdag rejected the proposition, and it was not until 1897 that it was agreed to introduce the work in 3 public normal colleges—Karlstad, Lund, and Helsingborg.

The Landsting (State Assembly), the Hushållningsförläggning (Industrial and Agricultural As-

sociation), and several private persons had worked zealously for this purpose. The Board of Aldermen of Stockholm introduced the sloyd in the city schools in 1876. In Gothenburg it had been introduced on a small scale in 1872, and five years later it was taught in all the schools.

At first the work consisted in teaching the elements of the various trades. In Stockholm the transition to a regular educational manual-training system took place in 1882, and in Gothenburg in 1887. In Gefle, Norköping, Linköping, Malmö, and other towns, the educational sloyd was taught from the outset.

At the Nääs Sloyd Normal College the method of instruction was originally worked out. Though the sloyd is not a compulsory subject, there are in Sweden nearly 1,500 schools, out of a possible 3,800, which have introduced the teaching of the Nääs system. At the Nääs College, established in 1875, up to September, 1890, 1,349 teachers (1,060 of them being Swedes) had taken courses.

In Norway the Storthing of 1866 accepted the proposition of the Government, and decided to give to every public school in which sloyd was taught the sum of 80 kroner. The sloyd is taught in 6 public normal colleges, and also at the Fredrikshaldssloyd-forenings Arbeidsskole (Fredrickshall Sloyd Association Working School). The instruction in all the schools is in wood sloyd, and the pupils who have had at least two hundred hours' instruction and have done the required amount of work receive a special mention of this fact in their diplomas. According to the new Norwegian school law, the sloyd is compulsory for boys of the age of twelve years, and optional for younger or older pupils.

By the statute of May, 1866, manual work was made obligatory for the country schools of Finland, and optional for the city schools. In all teachers' seminaries some manual work is taught. In the public schools there are many woman teachers, and special courses have been arranged for them. The Finnish Hushållningssällskap encourages this work by giving yearly stipends and distributing models and drawings.

Educational sloyd is of recent date in Denmark. In the autumn of 1885 a Danish Sloyd Union was formed, which assisted the establishment of a Teachers' Sloyd School in Copenhagen, and the introduction of this work into 10 private high schools. It is generally in the high schools that the sloyd has been carried on. In 1882 the Kjöbenhavn-Husflidsforening (Copenhagen Home Industrial Society) established a large sloyd school for the children of the Kommuneskolerne (public schools).

In Germany the Deutscher Verein für erziehlische Knaben-handarbeit (German Association for Educational Manual Work for Boys) has been very successful in its propaganda in behalf of this movement, especially so when we take into consideration the conservatism that has always existed among German teachers. The governments of Prussia, Saxony, and Alsace-Lorraine have given both moral and material support to the system. Sloyd schools have been organized in many cities, and the German Government, which yearly calls a congress of the friends of sloyd instruction, has founded a normal college in Leipzig.

In southern Austria-Hungary, and in Bohemia,

the movement has progressed very rapidly. The sloyd has been introduced as an elective subject in the elementary schools. In Hungary this work dates from 1870, when the Minister of Public Instruction issued an order that instruction be given in at least one of the following subjects to all the boys of the primary schools, viz., agriculture, gardening, silk cultivation, or sloyd. In 1881 manual training was made compulsory in 24 state seminaries for teachers, and in the Normal College of Buda-Pesth a three years' course was introduced.

In Russia, in the State Normal College of St. Petersburg and in several other teachers' seminaries of that city, since 1884 sloyd has been taught. For lack of means the work has progressed but slowly. In the Baltic provinces much has been done to further the Swedish system.

The local governments of several of the cantons of Switzerland have, during the past seven years, supported private efforts for establishing sloyd courses for teachers.

About four years ago a commission of 17 gentlemen was sent by the Italian Minister of Public Instruction to study the manual-training systems of Europe, and more especially the Swedish system of sloyd instruction. Each member of this body took a course at Nääs, and since then has personally directed a class for teachers at home.

The French law of March 28, 1882, made manual training compulsory in all normal as well as public elementary schools. At that time the École Normale Speciale pour l'Enseignement du Travail Manuel (Special Teachers' Seminary for Manual-training Instruction) was established. Though this instruction has been abolished, the study of the subject is carried on in about 100 schools of Paris.

The officers of the late Liberal Government of Belgium had begun to make arrangements to introduce the sloyd in normal and primary schools when, through the election of 1884, they were compelled to go out of office. The members of the present Clerical ministerial party expressed their views in 1887, at which time the Minister of Public Instruction said he had had the greatest sympathy with the movement, and the Government would soon take active steps in the matter. As a result courses for teachers were formed, all of which have been largely attended. Two societies have worked for its introduction in the public schools.

In England a very active propaganda in favor of the adoption of the Swedish sloyd has been going on. The most recent school laws are strongly in sympathy with the movement, and many school boards have made arrangements for the introduction of the system. A great many teachers have studied at Nääs, and several societies have been organized by those interested in the matter. The new school law of Scotland is even stronger in its sloyd clause than the English law.

American teachers have shown a deep interest in educational manual work, and various systems of manual training have been introduced in the school courses. In New York, Boston, San Francisco, and other cities the Swedish sloyd has been introduced in private institutions.

The Argentine Republic, Chili, and Uruguay have sent representatives to Nashville to study the school, with a view to adopting it in their primary schools.

Holland, Spain, and Brazil have likewise taken steps in this direction.

SOUTH CAROLINA, a Southern State, one of the original thirteen, ratified the Constitution May 23, 1789; area, 3,750 square miles. The population, according to each decennial census, was 249,073 in 1790; 345,591 in 1800; 415,115 in 1810; 502,741 in 1820; 581,185 in 1830; 594,398 in 1840; 668,507 in 1850; 703,708 in 1860; 705,000 in 1870; 955,577 in 1880; and 1,151,149 in 1890. Capital, Columbia.

Government.—The following were the State officers during the year: Governor, J. Gary Evans; Lieutenant Governor, W. H. Timmerman; Secretary of State, D. H. Tompkins; Attorney-General, William A. Barber; Treasurer, W. T. C. Bates; Comptroller, James Norton; Superintendent of Education, W. D. Mayfield; Adjutant General, J. Gary Watts; Superintendent of Agriculture, T. H. P. Allison; Railroad Commissioners, W. D. Evans, J. C. Wilson, H. R. Thomas; Dispensary Commissioner, F. M. Mixson—all Reform Democrats; Chief Justice of the Supreme Court, Henry McIVER; Associate Justices, Eugene B. Gary and Y. J. Pope, Democrats.

Finances.—The balance in the treasury Oct. 31, 1894, was \$203,256.24. The receipts during the year ending Oct. 31, 1895, were \$1,971,802.20. The payments amounted to \$1,902,952.52; and the balance remaining was \$272,196.01. The principal sources of receipt were: Taxes, \$845,298.54; dispensary, credited dispensary account, \$802,231.01; dispensary, appropriation of, December, 1892, refunded general account, \$50,000; phosphate royalty, \$93,308.71; privilege tax on grinders, \$30,135.93; loans effected under acts of 1893-'94, \$100,000.

The expenditures included: Education, \$225,018.00; charitable, penal, and sanitary expenses, \$160,511.60; interest on public debt and expenses, \$269,140.05; dispensary, \$750,323.58; printing, \$19,607.52; pensions, \$51,109.70; maintaining militia, 1893-'94 and 1894-'95, \$20,000; election expenses, \$18,549.71; Constitutional Convention appropriation, \$3,306.63.

The cash balance Dec. 31, 1895, was \$229,973.70. The new Constitution changes the close of the fiscal year from Oct. 31 to Dec. 31. The balance against the State Oct. 31, including consolidated bonds, balances of appropriations undrawn, &c., was \$7,044,916.58. The Constitution requires \$75,000 yearly of the receipts from phosphate payments to be set apart as a cumulative sinking fund.

The taxable property in the State amounts to \$169,419,251, and the State taxes assessed against the counties to \$762,315. The total of poll taxes is \$251,155.

Education.—During the year ending Oct. 31, 1895, the number of white pupils enrolled in the free public schools was 103,729, and of colored 119,292. The total enrollment was 3,745 less than in 1894, but the total for that year was 3,616 greater than in any previous year. According to the reports of the county school commissioners, the expenditures for the year were

\$563,743.06, of which \$470,093.67 was for salaries. The cost per capita ranged from \$16.31 in Charleston County to 85 cents in Beaufort; the average was \$17.77. The average length of session was four and three tenths months.

The Winthrop Normal and Industrial College for Women, at Rock Hill, was opened Oct. 15 with an enrollment of 304, which was soon increased to 510, the full capacity of the institution. About 100 applications for admission had to be refused. The expenses for the year of nine months at the college are \$101.50, not including tuition, which is \$40 to those that are able to pay it. The cost of the institution was \$200,000, of which Rock Hill gave \$60,000.

Clemson Agricultural College had a total enrollment of 572. The income was \$107,798.17, of which \$15,000 came from the Hatch fund and \$10,000 from the Merrill fund. The per capita support amounts to \$287.17. The privilege tax on fertilizers is devoted to this institution.

The South Carolina College had an enrollment of 180 for the year against 160 in 1894 and 68 in 1893. The college was opened to women this year, and 13 were in attendance. The estimate of expenses for the year was \$24,000. A summer school held at the college for four weeks had an average attendance of 200.

The Military Academy had upon its rolls 148 cadets, of whom 66 were beneficiaries. The cost per capita for support of the beneficiaries was \$293.80.

Claflin University, for colored students, had an enrollment of 570. A class of 20 was graduated. Claflin College and Claflin University have been united and operating as one institution for many years; but by the new Constitution it is made necessary to separate them. The new institution will be known as the Colored Normal Industrial Agricultural and Mechanical College.

Charities.—The name of the insane asylum has been changed to Hospital for the Insane. The total number of patients under treatment during the year was 1,157; daily average, 891. The cost per capita was \$118.76, or about 62 cents a day.

The estimated cost of the Deaf and Blind Asylum for 1896 was, for support, \$37,500; for buildings for colored children, \$6,000; and for electric-light plant and other expenses, \$6,000.

The Penitentiary.—The report for the fourteen months ending Dec. 31, 1895, shows that at the beginning of that period there were 1,002 prisoners in the Penitentiary and the reformatory camps; the whole number in prison during the time was 1,697, and at the end of the period there were 800 remaining. The decrease in the number of prisoners is due to the sentencing of short-term convicts to the county chain gang. The aggregate receipts for the fourteen months were \$147,060.80; estimated value of crops on hand, \$15,000; amount due from various fees and other sources, \$5,242.54; making a total of \$167,303.34. The disbursements were \$144,921.88.

Industries and Products.—Charities were issued during the year in corporations with an aggregate capital stock of \$3,367,700, against \$2,910,700 in 1894. The increase in cotton

manufacture was very great. In 1894 5 companies for the manufacture of cotton were chartered, the capital stock amounting to \$465,000. In 1895 20 were chartered, with a total capital of \$2,765,000.

At the beginning of the year (Sept. 1, 1894) the phosphate-mining companies had rehabilitated their plants from the effects of the cyclone of August, 1893, and they have added saving devices, so as to reduce the cost of mining to a minimum. The number of tons of rock shipped for the year ending Aug. 31, 1895, was 174,400.

The royalty paid to the State amounted to \$87,657.20. The whole number of tons mined during the year was 201,400.

The inspector's report says: The outlook of the business is gloomy in the extreme. Prices have sunk to a figure never before reached. It is impossible to get in Europe now even as high as 6d. a unit. The companies are unable to net more than \$2 a ton. South Carolina no longer has a monopoly of this business, deposits having been discovered in Florida, Tennessee, France, Algiers, and Venezuela.

There was a large decrease during the year in the acreage devoted to the cotton crop, and at the same time there was an immense gain in the acreage devoted to the living crops.

There was a great increase in the tobacco acreage. The estimated yield of rice was 850,000 bushels.

The receipts of cotton at Charleston, up to July 5, were 427,447 bales, against 405,031 at the same date in 1894.

Railroads.—The roads that were in the hands of receivers have been reorganized. The entire mileage in the State is owned or controlled by the Southern Railway, the Seaboard Air Line, and the Atlantic Coast Line. The freight charges on fertilizers were deemed too heavy, and the Railroad Commissioners fixed a rate which they considered just; but the companies obtained an injunction. The South Carolina and Georgia Railroad has become a bonded line.

The Dispensary.—The report of the State Liquor Commission for the year is thus summarized:

The local dispensaries sold liquor to the value of \$1,076,963.95, on which the towns and counties netted a profit of \$106,131.28. The profits to the State itself were \$133,467.77 on sales to the local dispensaries amounting to \$903,055.63. The report claims an additional outstanding profit for the State for the period under review of \$25,571.83, making a total profit to the State for eleven months of \$159,039.62. The profits of the towns and counties on retail sales were almost exactly 10 per cent., while the State's profits on wholesale dealings were about 16 per cent. The total profits to the State since the dispensary system went into operation, July 1, 1893, to Dec. 31, 1895, are placed at \$243,816.27.

The "dispensary war" continued in one form and another through the year. The principal event in it was a decision by Judge Simonton, of the United States circuit court, in reference to that part of the law forbidding persons to import liquors from other States, even for their own use. He held these provisions to be a violation of the United States Constitution, in that they are a discrimination against interstate commerce and against all citizens of South Carolina

other than the dispensary agents. This decision would not destroy the law as a whole, but only that part of it which prevents the individual from carrying liquor into the State for his own use; it would set aside the authority on which the constabulary have searched private houses for contraband liquors, and therefore remove the most objectionable feature of the law.

There was also an injunction from Judge Goff forbidding the seizure of liquor shipped into the State. As the order was disregarded, the commissioner and two constables were summoned to show why they should not be attached for contempt. In June 3 constables were sent to jail in Charleston. On the other hand, "contempt cases" were brought before the courts by the State authorities; in one case a man was sentenced by a circuit judge to eight months' imprisonment for selling liquors contrary to the order of another judge; he was also condemned to pay a fine of \$200. The case came before the Chief Justice of the Supreme Court, who discharged him without touching the constitutionality of the law, on the ground principally that the contempt proceedings were unconstitutional.

The Constitutional Convention.—The great event of the year in the State was the holding of a convention to revise the Constitution, which opened Sept. 10 and ended Dec. 4. An election was called for making choice of delegates, to take place in August. The constitutionality of the registration act, passed by the Legislature of 1894, had been called in question, and was in the State Supreme Court, no decision having been rendered. In April an order was obtained from Judge Goff, of the United States circuit court, granting a temporary injunction against the supervisor of registration of Richland County, to prevent him from carrying out the provisions of the act, some of which were averred to be "burdensome and harassing to the electors, and unreasonable and unnecessary, and the same so limit, abridge, and qualify the privilege of registration that they result in a practical denial of the right to vote to those electors who, by the operation of the unconstitutional provision of the General Statutes of 1892 and Revised Statutes of 1893, are now unregistered"; and in violation of the State Constitution "in this, that they add to the qualifications of electors provided for in the said Constitution, a further qualification not therein provided, to wit, registration as required by the several sections" of the act of 1894; and it was further declared that they "undertake to add to the qualification of the electors of the State of South Carolina qualifications not prescribed by the Constitution of the United States." In brief, the understanding of the law was that it was framed for the purpose of depriving the negro of his vote. Judge Goff also issued an order to the Governor, the commissioner of elections, and others, enjoining them from any action looking to the holding of the election. The case was argued in May. Judge Goff's decision was, that the election must be held with an open ballot. There was an effort to persuade the Governor to call an extra session of the Legislature for the purpose of passing a new registration law, but he refused, and issued a proclamation, May 14, from which the following are extracts:

The restoration of white supremacy in 1876 placed in office and in leadership of the affairs of the State Wade Hampton as Governor and afterward as United States Senator; Charles H. Simonton, chairman of the Judiciary Committee and leader of the House of Representatives, later district and circuit judge of the United States Court; and John C. Sheppard, speaker of the House of Representatives, Lieutenant Governor, and afterward Governor. In 1892, under the leadership of these men, the Legislature passed the laws known as "the election and registration acts," designed to preserve white supremacy and a white man's government. These laws worked admirably, and up to this proceeding no complaint has ever been heard of their injustice, oppression, or criminality. The union who dared raise his voice against them was denounced as an enemy of his State. Those who were too young to hold office and take part in such affairs were taught to respect these men as patriots and their handiwork as the palladium of our liberties. The regime, becoming arrogant and distasteful to a majority of our people, and repugnant in their policy to our institutions, was overthrown, and the people in 1895, by the election of Benjamin R. Tillman, as Governor, declared that it was not their intention to create an oligarchy when in 1876 they threw off the yoke of the negro and the carpetbagger. Two appeals have been made to reverse this verdict of the sovereign people, but it has been sustained each time with vehement determination. South Carolina is enjoying an era of industrial improvement; factories are being built in greater number than elsewhere in the South; the credit of the State ranks higher than ever in its history, our bonds not being purchasable at a premium of less than 10 per cent. The march of progress is about to be stopped; the black pall of negro domination hovers over us. We must meet the issue like South Carolinians. There are only two flags—the white and the black. Under which will you enlist? It is fortunate that the issue comes at this time, when a Constitution is to be made, guaranteeing white supremacy once and forever. The Constitutional Convention must be controlled by white men, not white men with black hearts nor negroes. Constitution or no Constitution, law or no law, court or no court, the intelligent white men of South Carolina intend to govern her.

An appeal was taken to the United States Court of Appeals at Richmond, which resulted in the reversal of Judge Goff's decision, June 11. In the State Supreme Court the case against the law was dismissed, on the ground that the court had no jurisdiction, and that the complainant had adequate remedy at law; but the Chief Justice dissented from the opinion of the majority of the court, holding that it had jurisdiction; and, going into the merits of the case, he gave as his opinion that "the many provisions and requirements set forth in the registration laws are prerequisites to the right of the ballot are burdensome and unreasonable, and could not have been intended to merely regulate the right of suffrage, but, upon the contrary, the effect of the provisions of the law are to abridge and impede the citizen in registering and voting."

There were 160 delegates to the convention, of whom only 40, as was reported, were out-and-out opponents of the Reform, or Tilden Democracy, in control of the State government. Six were negroes.

Gov. Evans was made president of the convention.

The most important work of the convention, and that which was waited for with greatest interest, was the section prescribing the qualifications for suffrage. It was understood that

these would be such as to disfranchise the greater part of the negroes, and that the Mississippi plan, or a modification of it, would be adopted. Senator Tillman was chairman of the Committee on Rights of Suffrage. The following statement of the action of the convention on this and other important subjects is taken from the Governor's message to the Legislature of 1905:

The requirements of the Constitution are "residence in the State two years, in the county and precinct in the polling precinct in which the elector offers to vote four months, and the payment six months before any election of any poll tax then due and payable. Ministers of the Gospel and school-teachers are entitled to vote after six months' residence in the State.

Registration which shall provide for the enrollment of every elector once in ten years, and also an enrollment during each and every year of every elector not previously registered.

All male persons of voting age applying for registration who can read any section of the Constitution submitted to them by the registration officers, or understand and explain it when read to them.

Those are the requirements up to January, 1898. After that time a person applying for registration, if otherwise qualified, must be able to both read and write any section of the Constitution submitted to him by the registration officers, or show that he owns and has paid all taxes collectible during the previous year on property in the State assessed at \$200 or more. The payment of all taxes, including poll tax, is a prerequisite to voting.

It is incumbent upon you to prescribe the manner of holding elections and of ascertaining the results of the same. There is no necessity for any change at this time in our law in this particular. Our people are accustomed to the right-form law, and there can be no just or valid objection to the manner of obtaining the results of elections. We have been served with notice that this article of our Constitution would be tested before the United States Supreme Court, and while I have no faith as to the result and am fully convinced of its constitutionality, still should another Guff come along, whom "insurrection made it his duty" to set aside our registration law day before election, in such an emergency our right-form law would be some protection.

The session of your honorable body have been changed to the second Tuesday in January, with a three limit of forty days. This limitation does not apply to the first 4 sessions under the new Constitution.

You are expressly forbidden to enact local or special laws upon the following subjects:

1. To change the names of persons or places.
2. To lay out, open, or work roads or highways.
3. To incorporate cities, towns, or villages or change, amend, or extend the charters thereof.
4. To incorporate educational, religious, charitable, social, manufacturing, or banking institutions not under the control of the State.
5. To incorporate school districts.
6. To authorize the adoption or legitimation of children.
7. To provide for the protection of game.
8. To provide for the age at which citizens shall be subject to trial or public duty.
9. To fix the amount of compensation to be paid to any county officers, etc.

It is your duty to enact laws limiting the number of acres of land which any class or any corporation controlled by alone may own within this State.

You are required to provide by legislation for the punishment of any citizen, from, county, or territorial, and for his removal from office, from whom a justice in his lawful capacity has been seized or taken, through his negligence, permission, or connivance, by a mob or other unlawful assemblage of per-

sons, and who has suffered bodily violence or death, and also to provide for the maintenance of a civil action for damages against the county in cases of lynching when death ensues, and further for an action by the county for the damages against the parties engaged in the lynching. There have occurred during the last year 4 cases of lynching within the State, and not one has been for the crime generally regarded as justifying such action.

It is your duty to provide a general system for the assessment of property for taxation, and this assessment shall be taken by all municipalities and other subdivisions of the State as their basis for taxation. You are authorized to impose a graduated tax upon incomes and a license on occupations and business.

The people are to be congratulated upon the liberal manner in which the Constitution has provided for the common schools of the State. The common schools are required to be separate and distinct for white and colored children, and pupils of either race are prohibited from attending the schools so set apart for the other race.

All the net income to be derived by the State from the sale of licenses for the sale of intoxicating liquors, all gifts to the State where the purpose is not designated, all escheated property, the net assets or funds of all estates or copartnerships in the hands of the courts of the State where they have been no claimants for the same within the last seventy years, and the direct-tax fund are set apart as a permanent school fund.

It is made the duty of your honorable body at your first session after the adoption of the Constitution to provide such proper and liberal legislation as will secure an annual pension to every indigent or disabled Confederate soldier and sailor of this State and of the late Confederate States who are citizens of this State, and also to the indigent widows of Confederate soldiers and sailors.

By a vote of almost 2 to 1, a provision was introduced that divorces from the bonds of matrimony should not be allowed in the State. After an exhaustive debate, a section was passed providing that "the marriage of a white person with a negro or mulatto or person who shall have any negro blood shall be unlawful and void, and the parties to such marriage, upon conviction, shall be punished as the General Assembly may prescribe."

There was a lively contest over the name to be given to a new county, "Butler" and "Saluda" being the names proposed. The petition of the people of the new county gave the name "Saluda"; but it was sought by some members of the convention to honor the family of which ex-Senator Butler is now the representative by giving its name to the county. The debate lasted for three hours, with bitter personalities on both sides, after which the county was named Saluda. The Constitution was ratified by the convention itself, and will not be submitted to a vote of the people.

SOUTH DAKOTA, a Western State, admitted to the Union Nov. 3, 1889; area, 77,650 square miles; population, according to the census of 1890, 328,808. Capital, Pierre.

Government.—The following were the State officers during the year: Governor, Charles H. Sheldon, Republican; Lieutenant Governor, Charles N. Herried; Secretary of State, Thomas Thomson; Treasurer, Kirk G. Phillips; Auditor, J. E. Hipple; Attorney-General, Coe I. Crawford; Adjutant General, George A. Silsby; Superintendent of Public Instruction, Frank Crane; Commissioner of Labor Statistics, F.

A. Wheeler; Railroad Commissioners, G. A. Johnston, E. F. Conklin, Jay Manson; Chief Justice of the Supreme Court, Dighton Corson; Associate Justices, Alphonso G. Kellam, Howard G. Fuller; Clerk of the Supreme Court, Ivan W. Goodner.

At the beginning of the term of office of the present State Treasurer, Jan. 9, 1895, the books showed cash on hand amounting to \$367,020.70, which amount the former Treasurer, W. W. Taylor, failed to turn over, and it appeared that he had absconded with the State's money. After several months' absence he voluntarily returned, and upon arraignment in the circuit court, under charge of embezzlement of public funds, pleaded guilty, and was sentenced to five years' imprisonment. On appeal to the Supreme Court, the term was reduced to two years, on the ground that the crime committed was misuse or appropriation of public funds. Before Taylor was committed to the Penitentiary in October he had made over to the State \$127,552.24 in cash and property valued at \$70,000.

One consequence of this defalcation was the appointment, by joint resolution of the Legislature, of a committee to investigate the action of Thomas H. Ruth, ex-Commissioner of School and Public Lands. The report of the committee severely criticised the ex-Commissioner of Public Lands for inattention to duty, for neglect of the statutory provisions, and for neglect of State interests in favor of his own. It charged that through his neglect the State lost a large sum of interest in 1893, and that, as the result of his failure to apportion the money as required by law in 1894, Taylor robbed the school fund of \$20,000. Accordingly, suit was brought for \$27,000.

Finances.—By action of the Legislature of 1895 provision was made for annual instead of biennial reports from the Treasurer and the Auditor. From the report of the former, covering the period between June 30, 1894, and July 1, 1895, the following statements are gathered: On taking office the Treasurer found that the State was without funds to meet any of its obligations, and that funding warrants to the amount of \$220,000 were due Jan. 1, 1895. An extension of their time of payment for one year was secured, and, from revenues collected, \$100,000 of the warrants were paid prior to July 1, and provision will be made for the redemption of the \$120,000. To meet the immediate requirements of the State for funds, the Legislature authorized the issuing of funding or revenue warrants based upon revenues assessed but not yet collected. Of these, \$304,600 have been issued to defray the current expenses, \$204,600 of which will become due April 1, 1896, and \$100,000 April 1, 1897. State bonds to the amount of \$98,000, bearing interest at 4½ per cent. per annum, were also issued and sold and the proceeds applied to make good the deficiency in the school fund, occasioned by W. W. Taylor's defalcation.

The Treasurer makes his report in two parts to cover the period from July 1, 1894, to Jan. 9, 1895, when W. W. Taylor was Treasurer, and the period from Jan. 9, 1895, to June 30, 1895. At the beginning of the first period there were

in the treasury \$433,026.58; the receipts were \$298,775.82; the disbursements were \$354,731.91; the unexpended balance, Jan. 8, 1895, was \$367,020.59, which balance was the amount of Taylor's defalcation. The receipts during the second period were \$822,712.75; disbursements, \$502,222.94; balance July 1, 1895, \$320,489.81. Of this amount, \$22,746.29 was paid over by W. W. Taylor.

The indebtedness of the State July 1, 1895, was as follows: Coupon bonds, \$870,700; registered bonds, \$267,500; funding warrants, \$424,000; total indebtedness, \$1,562,200.

The valuation of railroads in 1895 was \$9,193,247; of telegraphs, \$127,116; of telephones, \$44,750; express companies, \$51,500; sleeping-car companies, \$12,000, making a total of \$9,418,613. The valuations of lands was \$74,918,479; of town lots, \$16,863,655; of personal property, \$20,550,405. The total valuation in 1895 was \$121,751,151.

The amount of taxes paid by insurance companies direct to the State was \$5,456.86, making the total receipts from insurance companies \$24,657.92, against \$27,583.60 for 1894. Reports filed in 1895 give the ratio of losses paid to premiums received as 53-2 per cent.

The appropriations from the general fund made during the year amounted to \$746,160.77; warrants issued, \$718,923.86; unexpended balance July 1, 1895, \$27,236.91. Appropriations from the interest and income fund were \$308,985; warrants issued, \$308,273.47; unexpended balance, \$709.53.

Education.—The regents have eight institutions under their charge: The State University, at Vermillion; Agricultural College, at Brookings; United States experiment station, at Brookings; State School of Mines, at Rapid City; State normal schools, at Spearfish, Madison and Springfield; and the State Geological Survey. The State appropriates for their support about \$60,000 annually, and the United States \$26,000.

The fiscal year of all now ends June 30. The enrollment at the university Dec. 1 was 224; at the Agricultural College, 250; the Spearfish and Madison normal schools had about 170 students each, and were crowded. The Springfield normal has no other existence than that involved in a "location" by an old-time Legislature, an assignment of 40,000 acres of public lands by the last Legislature, and a board of 5 trustees.

Railroads.—The Railroad Commissioner in December furnished the following figures: The number of railroad companies doing business in the State is 14, with a total mileage of 2,860; the number of men employed in the State is 5,046; total compensation for the year, \$2,950,507; people killed during the year, 8; people injured, 49; number of elevators and warehouses doing business, 657. About 20 new elevators and warehouses have been erected in the eastern part of the State.

Yankton Reservation.—The lands ceded by the Yankton Sioux Indians, being 168,000 acres in a rich farming country in the southern part of the State, were in April opened to settlement. An attempt was made by the State to take possession of a large part of these lands for the normal schools and other institutions, under

a general congressional act of March 2, 1890, which in terms permits States to select school lands from the surplus of surrendered Indian reservations. In the case of the Yankton reservation there was a special enactment by Congress, dated Aug. 13, 1894, which provided for the disposal of the surplus only under homestead and town-site laws. In an argument before the Secretary of the Interior it was concluded that the general law of 1890 did not set aside the special treaty-confirming law of 1894, and a decision to that effect was rendered.

Legislative Session.—The Legislature met on Jan. 8, and sat until March 8. The revenue laws were modified and the railroad laws were amended to strengthen the hands of the Railway Commissioners, and there was some valuable irrigation and artesian-well legislation; but no radical changes in general laws were made. A law was enacted providing for checking the accounts of the State Treasurer by the Governor each month. Other laws provided for the organization of county mutual insurance companies. A measure was passed providing that a married woman who purchases necessaries for her family on her own account, or promises to pay for them in consideration of the sale and delivery thereof to her and her husband or either of them, shall, in case of nonpayment, be liable in action to recover payment therefor to the same extent that her husband would be liable under a similar purchase or promise. Among other laws enacted were these:

Authorizing the flying of the national flag over school buildings.

Providing that trees and shrubbery shall not be considered real property.

Providing that no insurance shall be placed except through a local agency subject to all the terms and other provisions.

Locating the blind asylum at Gary.

Authorizing county commissioners and township supervisors to furnish seed grain.

Providing for the incorporation of associations to provide homes for destitute children.

Prohibiting racing and other public sports on May 29.

Providing for loans on money in the hands of public corporations for labor on public works.

The appropriations for 1895, less bond interest and salaries of officials, were \$293,097.30; for 1896, \$290,574.

Early in the session R. F. Pettigrew, Republican, was re-elected to the United States Senate.

SPAIN. a constitutional monarchy in south-western Europe. The legislative power is vested in the Cortes, consisting of a Senate of 190 members, of whom 122 are appointed for life and 57 are hereditary or official members, and a Congress of 432 members, elected for five years by indirect suffrage. The present King is Alfonso XIII, born May 17, 1886, son of Alfonso XII, deceased, and of Maria Christina, an Austrian archduchess, who acts as Regent during the minority of her son.

The ministry, first constituted in December, 1892, was composed in the beginning of 1895 as follows: President of the Council, Mateo P. Sagasta; Minister of Foreign Affairs, S. Morcufo; Minister of Justice, R. Capdepon; Minister of War, Gen. J. Lopez Dominguez; Minister of Marine, Admiral M. Pangua; Minister of Fi-

nance, Amos Salvador; Minister of the Interior, A. Aguilera; Minister of Agriculture, Commerce, and Public Works, M. Groizard; Minister of the Colonies, Señor Becerra. M. Groizard was afterward succeeded by J. L. Puigcerver, and when Señor Moret resigned he took the portfolio of Foreign Affairs. Señor Maura became Minister of Justice when Señor Salvador retired and Señor Capdepon became Minister of Finance. Señor Becerra retired from the Ministry of the Colonies, being succeeded by Señor Abarzuza.

Spain has an area of 197,670 square miles, with a population at the last census (1887) of 17,565,632. The net emigration in 1892 was 8,258, mostly directed to Brazil, the Argentine Republic, and Uruguay.

Finances.—The budget for the financial year 1894-95 estimates the revenue at 744,726,353 pesetas, or francs, of which 291,423,473 pesetas are the product of direct taxes on land, mines, Government salaries, registration, etc.; 281,768,000 pesetas are raised by customs and internal-revenue taxes; 129,940,000 pesetas are derived from stamps and Government monopolies; 22,124,880 pesetas are the receipts from national property; and 19,470,000 pesetas come from the public treasury. The expenses are estimated as follow: Civil list, 9,500,000 pesetas; Legislature, 1,526,585; public debt, 309,219,669; indemnities and pensions, 55,067,477; judiciary, 1,817,231; presidency of the Council of Ministers, 891,050; Ministry of Foreign Affairs, 4,709,142; Ministry of Grace and Justice, 52,690,584; Ministry of War, 138,872,216; Ministry of Marine, 22,502,951; Ministry of Public Works and Public Instruction, 76,979,883; Ministry of the Interior, 26,924,554; Ministry of Finance, 14,836,368; expenses of collection, 27,377,183; Fernando Po, 655,000 pesetas; total revenue, 738,619,893 pesetas.

For 1895-'96 the revenue was estimated in the budget at 758,500,000 pesetas and expenditure at 765,500,000 pesetas.

The public debt on Jan. 1, 1893, amounted to 5,962,043,090 pesetas, made up as follows: Perpetual external debt, paying 4 per cent. interest, 1,971,157,000 pesetas; perpetual internal debt, paying 4 per cent., 2,274,660,450 pesetas; amortizable debt, paying 4 per cent., 1,714,075,000 pesetas; due on public works, 562,000 pesetas; due on public roads, 252,000 pesetas; arrears due to employees, 1,342,640 pesetas. There are, besides, a debt of 3,000,000 pesetas owed to the United States debts in favor of corporations and the clergy amounting to 725,836,000 pesetas, a floating debt of 195,516,000 pesetas, and the Cuban debt.

The Government raised money in Spain for the Cuban expedition, depositing Cuban bonds as security, and in October made an arrangement with Paris and Dutch bankers for a loan on the same security of 75,000,000 francs.

Communications.—The post office in 1893 carried 81,125,000 internal, 18,779,000 foreign, and 127,900 transit letters, 666,000 internal and 400,000 foreign postal cards, 47,098,000 internal and 19,238,000 foreign newspapers, circulars, and packets, and money letters remitting 170,690,000 francs. The post-office receipts were 23,882,301 francs and expenses 11,055,356 francs.

Commerce.—The value of the commerce in 1893 with the different foreign countries is given, in pesetas, in the following table:

COUNTRIES.	Imports.	Exports.
France.....	204,800,000	205,700,000
Great Britain.....	161,900,000	181,700,000
America.....	164,500,000	194,900,000
Portugal.....	20,000,000	80,200,000
Belgium.....	28,000,000	14,500,000
Germany.....	20,800,000	14,500,000
Russia.....	82,500,000
Sweden and Norway.....	25,430,000	2,400,000
Philippine Islands.....	20,800,000	22,700,000
Northern Africa.....	28,100,000	5,600,000
Italy.....	16,500,000	8,100,000
Netherlands.....	7,800,000	12,000,000
Turkey.....	18,200,000
Other countries.....	34,100,000	17,100,000
Total commerce.....	770,700,000	709,700,000

Some of the imports and their values were: Breadstuffs, 79,547,000; cotton, 76,075,000; coal, 49,420,000; timber, 36,740,000; tobacco, 34,532,000; codfish, 24,864,000; machinery, 20,377,000; chemicals, 18,597,000; iron, 17,782,000; ships, 16,927,000; hides and skins, 15,912,000; coffee, 14,668,000; cacao, 13,969,000; wool, 13,946,000; sugar, 12,979,000; linen yarn, 11,638,000; silks, 10,593,000; woollens, 10,287,000; raw silk, 8,931,000; petroleum, 8,307,000 pesetas. The values of the principal exports were: Wine, 94,873,000; lead, 54,942,000; cottons, 48,780,000; copper, 45,560,000; iron, 43,066,000; olive oil, 27,845,000; boots and shoes, 26,310,000; cork, 23,161,000; raisins, 16,394,000; oranges, 14,627,000; wool, 12,298,000; animals, 10,616,000; almonds, 10,358,000; quicksilver, 8,724,000; grapes, 8,082,000; skins, 8,015,000 pesetas.

Navigation.—During 1893 there were 6,148 Spanish steamers, of 5,304,174 tons; 6,786 foreign steamers, of 5,671,495 tons; 1,892 Spanish sailing vessels, of 171,095 tons; and 1,373 foreign sailing vessels, of 303,434 tons, entered at Spanish ports; in all 16,199 vessels engaged in foreign commerce, of the aggregate burden of 11,450,198 tons. The total number cleared was 16,039, and the total tonnage 11,414,057 tons.

The merchant navy on Jan. 1, 1893, comprised 1,233 sailing vessels, of 196,650 tons, and 474 steamers, of 652,139 tons.

The Army.—The law of 1885 made military service obligatory for twelve years from the age of nineteen, of which period three years of service with the active army are legally required. Exemption can be bought for 1,500 pesetas, and substitution is allowed between brothers. The annual contingent, which has been 49,000, was to be increased by the operation of the law of 1891 to 80,000 men. The peace effective for 1895 was returned as follows: General officers, 240; general staff, 232 officers; infantry, 6,098 officers and 45,679 men; cavalry, 1,360 officers and 13,139 men; artillery, 963 officers and 8,366 men; engineers, 425 officers and 3,399 men; telegraph brigade, 7 officers and 226 men; total, 9,315 officers and 70,829 men, with 14,655 horses and mules and 396 guns. The war strength was 176,035 men, with 14,250 horses and mules and 590 guns. The army bill of 1894 provided for the maintenance of 82,000 troops in Spain, 13,000 in Cuba, 11,000 in the Philippines, and 7,000 in Puerto Rico. The ministers on Oct. 17,

1895, calculated on a present effective of 85,000, of whom 24,000 were for the colonies.

The Navy.—The naval force consists of 1 first-class battle ship ("Pelayo"), of 9,800 tons, protected with 18 inches of armor and armed with 2 12½-inch, 2 11-inch, and 19 smaller guns; 6 belted cruisers ("Infanta Maria Teresa," "Vizcaya," "Almirante Oquendo," "Cataluña," "Cardenal Cisneros," and "Princesa de Asturias"), each having a displacement of 7,000 tons and a speed of about 20 knots and armed with 2 11-inch guns and 5 5½-inch guns; 1 armored cruiser ("Emperador Carlos"), of 9,235 tons displacement and a larger light armament than the above; 2 deck-protected cruisers ("Alfonso XIII" and "Lepanto"), 2 frigates, 41 small cruisers and gunboats, 5 torpedo gunboats, 1 torpedo catcher, 14 sloop gunboats, and 12 first-class, 20 second-class, and 1 third-class torpedo boats. The new cruisers, built in England and latterly in Spain, compare favorably with the same classes of vessels in any navy either in speed, cruising radius, or the completeness and distribution of the armament. The navy sustained a severe loss in March, 1895, when one of the new deck-protected cruisers, the "Reina Regente," foundered near the entrance of the Strait of Gibraltar with 400 men on board. She was a sister ship to the "Alfonso XIII," having a displacement of 4,800 tons, a primary armament of 4 7.8-inch guns, with 15 smaller guns and 5 torpedo tubes, capable of steaming 20.6 knots an hour. A smaller cruiser, the "Cristóbal Colon," was shipwrecked in October, and a sloop gunboat, the "Sanchez Barcizategui," was also lost in Cuban waters. The Government has acquired 19 small gunboats for the purpose of patrolling the coasts of Cuba.

Politics and Legislation.—A political crisis was brought on by a riotous attack made by military officers on newspaper offices in the middle of March. The "Resumen," a Republican sheet, in an article on the Cuban insurrection, charged the junior officers of the army, who were always eager to go to Cuba when there was no danger, with seeking to escape from being drafted to Cuba to fight the insurgents. Resenting this imputation of cowardice, a party of 35 young officers wrecked the office of the newspaper on March 14. On the following evening 60 officers, with a crowd of sympathizers, sacked the office of the "Globo," which had protested against these lawless doings, and wounded an editor and two assistants. Later they attacked the office of the "Heraldo," but could not force an entrance. The officers, whose number had increased to 400, then attempted to renew their attack upon the staff of the "Resumen," but desisted when the captain general begged them to disperse. On the following day the disturbance was discussed by the Cabinet and the Congress. The newspaper editors of Madrid met and resolved to notify the Government that they would suspend the publication of all the newspapers unless they received guarantees of the safety of their lives and property. Gen. Lopez Domínguez exonerated the riotous officers, and demanded that the offending newspaper editors should be tried by court-martial. Premier Sagasta and the other ministers would not assent because, while press offenses against

the army could formerly be brought before military tribunals, more recent laws, which had been declared valid by the highest court, provided that all press offenses except treason fell within the jurisdiction of the ordinary tribunals, and must be tried before a jury. A deputation of officers, headed by Marshal Martínez Campos, demanded of Premier Sagasta that he should suppress the "Resumen," and proposed to the Cortes severely repressive press laws. He had promised the newspaper editors that he would protect their liberty, and when the Minister of War and the officers of the army persisted in their demands he and his colleagues resigned on March 17. Martínez Campos, who was appointed for the emergency Captain General of Madrid in the place of Gen. Bermejo de Rada, issued orders forbidding the officers to make any demonstration. He was invited to form a military, but declined to undertake the task unless all other political combinations failed. He announced that the military code would be applied to libels upon the officers' corps, and told a deputation of newspaper men that they would undoubtedly be shot if they continued to insult the army. The editors of the "Resumen," the "Público," the "Justicia," the "Ideal," and several provincial papers were examined before military tribunals. Other journalists fled from the country to escape arrest. Republican deputies assumed the editorship of their organs in Barcelona and other places. Señor Sagasta could not be induced to retain office except on the condition of maintaining the existing press laws, his supporters having declared that they would firmly resist the demands of the military.

The Queen Regent then called upon the leader of the Conservatives, who were in a minority in the Congress and who had retired from office in 1892 as the result of a bitter quarrel among themselves relating to charges of municipal corruption made against Señor Bosch, then Alcalde of Madrid. Señor Cánovas organized a Cabinet on March 24, composed as follows: President of the Council, Cánovas del Castillo; Minister of Foreign Affairs, Duke of Tetuan; Minister of Justice, Romero Robledo; Minister of War, Gen. Anarraga; Minister of Marine, Admiral Beranger; Minister of the Interior, F. Coe Gayon; Minister of Finance, Navarro Revilla; Minister of the Colonies, Señor Castellón; Minister of Public Works, Señor Bosch.

The new Government sent Marshal Campos to Cuba to suppress the insurrection, obtained fresh credits for the campaign, and carried a bill raising the peace effective of the army from 71,000 to 82,000 men. The universal elections in May were carried, as usual, by the party in power, although the followers of Señor Piérola, who had protested in 1892 against the action of Romero Robledo in shielding alleged corruptionists, now became open opponents of the Government. They proposed a vote of censure on May 25 on the illegal interference of the officials in the elections, but Señor Sagasta rallied the Liberal majority in the support of the Government, defeating the motion by 196 votes against 27 votes of the Silveristas and Republicans. On June 1 the Chamber passed a vote of censure on the Government for not keeping promises made in the budget proposals by a majority of 28 votes. The

Ministerialists did not vote, and the Cabinet would not resign, having accepted office on the promise of Señor Sagasta that the Liberals would support them in passing the budget. Gen. Primo Rivera, the new Captain General of Madrid, was shot on June 3 by Capt. Primitivo Clavijo, an infantry officer who had a grudge against him. A proposal to abolish the export duty on wheat was defeated in the Chamber on June 24.

On Sept. 5 Señor Castellano, Minister of the Colonies, offered his resignation because Romero Robledo, who exercised an undue influence in domestic affairs, attempted to impose his will also in colonial affairs and inaugurate a policy of extermination in Cuba.

The Colonies.—The colonial possessions of Spain are Cuba and Puerto Rico in the West Indies, with an area of 45,205 square miles and 2,488,395 inhabitants (see CUBA); the Philippine Islands and their dependencies in the Sulu Archipelago, including the Caroline Islands, Palaos, and the Marianne Islands, having a total area of 116,256 square miles and 7,121,172 inhabitants; and the island of Fernando Po, with its dependencies of Annoboni and Coriseo, Elobey, and San Juan in Africa, having a total area of 783 square miles and 36,000 inhabitants. Spain claims a protectorate over Rio de Oro and the Adrar territory in northern Africa, which have an extent of 243,000 square miles and 100,000 people.

The budget of the Philippines for 1895 shows a revenue of £2,715,980 sterling, derived from direct and indirect taxation, a lottery, railroads, etc., and an expenditure of £2,650,026. The imports in 1893 were valued at \$24,000,000 and exports at \$30,500,000. The regular force maintained in Cuba is 19,571 men, which was increased during 1895 by an expeditionary force and the enlistment of guerrillas to 90,000 men. In Puerto Rico 187 officers and 3,200 men form the garrison; in the Philippines, 573 officers and 9,300 men. Besides the insurrection in Cuba the Spanish Government had to deal in 1895 with disturbances in the Philippine Islands. In an encounter with Mohammedan Malays in Mindanao on March 10 the Spanish killed 108, including the rebellious sultan, and lost 17 killed and 193 wounded. In July a Spanish force was ambushed in the northern part of Luzon by the natives who suddenly rose in revolt. They were subdued later by a column sent from Manila under Gen. Ria, who captured their fortified town, killing 116 and losing 17 killed and the same number wounded. In September there was fighting on the small island of Tatau between the crew of a Spanish gunboat and some native soldiers, who were overcome and taken to Manila, where they were tried by court-martial and shot. The Spanish Government in September refused the request of the United States minister that the American missionaries be permitted to return to the Caroline Islands and resume their labors.

SWEDEN AND NORWAY, two kingdoms in northern Europe, united in accordance with the treaty of Kiel, made Jan. 14, 1814, in the person of the sovereign. The throne in both monarchies descends in the order of primogeniture to the heirs of the house of Bernadotte. The King can declare war and conclude peace. Affairs common to the two monarchies are referred to a mixed Council of State. The reign-

ing King is Oscar II, born Jan. 21, 1829, who succeeded Carl XV, his brother, Sept. 18, 1872.

Sweden.—The legislative power is vested in the Riksdag, consisting of two houses. The First Chamber has 150 members, elected by the provincial and municipal bodies for nine years. The Second Chamber consists of 230 members, of whom 80 are elected in the towns by direct suffrage and 150 in the rural districts, part by direct and part by indirect suffrage. To have a vote a Swede must own land worth 1,000 kronor or farm land of the taxed value of 6,000 kronor, or pay taxes on an income of 800 kronor (1 krona = 24 cents).

The ministry in the beginning of 1895 was composed as follows: Minister of State, Erik Gustaf Boström; Minister of Foreign Affairs, Count Carl Lewenhaupt; Minister of Justice, August Östergren; Minister of the Interior, Victor Lennart Groll; Minister of Finance, Baron Fredrik von Essen; Minister of Education and Ecclesiastical Affairs, Gustaf Fredrik Gilljam; Minister of War, Baron A. E. Rappe; Minister of Marine, Jarl C. E. Christerson; Councilors of State, Baron Albert Lars Evert Akerhielm and Sven Herman Wikblad.

Finances.—The revenue is estimated in the budget for 1896 at 100,534,000 kronor, of which 19,070,000 kronor are classed as ordinary receipts, 674,000 kronor are surplus receipts of preceding years, 2,340,000 kronor are profits of the state bank for 1894, and 78,450,000 kronor are what are called extraordinary receipts. Of the ordinary receipts, 2,155,000 kronor are land taxes, 1,400,000 tonnage dues, 2,400,000 rent for domains, 665,000 poll tax, 7,200,000 net receipts of railroads, 1,335,000 receipts of telegraphs, 2,990,000 produce of forests, and 1,015,000 miscellaneous. Of the extraordinary receipts, 36,000,000 kronor come from customs, 8,500,000 from posts, 5,800,000 from stamps, 14,500,000 from the tax on spirits, 7,000,000 from the duty on beet sugar, 6,350,000 from the income tax, and 800,000 from various sources. The total expenditures are made to balance the receipts. Of 77,462,524 kronor of ordinary expenditure, 1,320,000 kronor are for the royal household, 3,812,550 for justice, 606,750 for foreign relations, 25,552,870 for the army, 6,996,300 for the navy, 5,596,406 for the interior, 13,026,508 for education and worship, 3,116,040 for pensions, and 17,435,100 for financial administration. Of this last sum, 2,593,000 kronor are required for collecting the customs duties, 450,000 for the control of the excise, 8,155,000 for the post office, 1,335,000 for telegraphs, 1,147,000 for forests, and 3,755,100 for other expenses. The extraordinary expenditures are 11,464,076 kronor, of which 4,414,700 kronor are for the army and navy and 7,049,286 for other purposes; the expenses of the debt, 10,207,400 kronor; reserve for the insurance of workingmen against disability, 1,400,000 kronor.

The public debt, contracted almost exclusively for the construction of railroads, amounted in 1895 to 293,151,387 kronor, paying from 3 to 4 per cent. interest. In January, 1895, the Government negotiated with Swedish, French, German, and English bankers for the conversion of the 4-per-cent. bonds, amounting to 29,000,000 kronor, into a new loan paying 3½ per cent.

Commerce.—The total value of the imports in 1893, inclusive of specie, was 332,649,000 kronor, and of exports 328,272,000 kronor. The principal imports and their values were: Rye and wheat, 28,287,000; coffee, 27,012,000; coal, 25,615,000; woollens, 20,003,000; iron goods, 12,947,000; cottons, 11,281,000; raw cotton, 9,616,000; sugar, 9,552,000; hides and skins, 8,852,000; fish, 7,948,000; machinery, 7,134,000; tobacco, 7,075,000; petroleum, 6,783,000; woolen yarn, 5,765,000; paper, 4,448,000; wool manufactures, 4,338,000; vegetable oils, 4,188,000; wool, 4,065,000; pork, 3,478,000; iron, 3,337,000 kronor. The principal exports were: Timber, 113,441,000; butter, 40,159,000; iron, 31,918,000; paper, 25,444,000; oats, 21,176,000; wool pulp, 10,920,000; fish, 9,887,000; matches, 7,858,000; cotton goods, 4,759,000; glass, 3,723,000; machinery, 3,603,000; animals, 3,359,000 kronor.

The commerce with the different foreign countries in 1893 is shown in the following table, which gives the values in kronor:

COUNTRIES.	Imports.	Exports.
Norway	81,189,000	16,111,000
Denmark and Finland	17,000,000	19,348,000
Germany	29,590,000	26,716,000
France	112,497,000	44,574,000
Netherlands	7,007,000	17,045,000
Belgium	11,899,000	11,490,000
Great Britain	86,225,000	120,564,000
Spain	4,247,000	79,000,000
Portugal	1,535,000	1,399,000
Switzerland	542,000	2,651,000
Italy	808,000	951,000
Austria	—	3,294,000
United States	10,850,000	628,000
West Indies	537,000	—
Australia	—	479,000
Asia	804,000	—
Other countries	5,808,000	775,000
TOTAL	332,649,000	328,272,000

Navigation.—There were 29,169 vessels, of 5,836,000 tons, entered at Swedish ports during 1893, of which 10,735, of 2,580,000 tons, were with cargoes; the number cleared was 28,044, of 5,870,000 tons, of which 20,744, of 4,585,000 tons, were with cargoes. The number entered included 12,331 steamers, of 4,412,000 tons; of those cleared, 12,420, of 4,435 tons, were steamers. Of the total number entered, 14,520, of 1,957,000 tons, sailed under the Swedish flag, 2,139, of 590,000 tons, under the flag of Norway, and 12,310, of 3,293,000 tons, under foreign flags.

The merchant navy in 1894 consisted of 2,844 sailing vessels, of 369,359 tons, 1,229 steamers, of 177,156 tons.

Communications.—There were 5,794 miles of railroad in operation at the end of 1894, of which 1,899 miles belonged to the Government and 4,835 miles to companies.

The number of paid internal telegrams was 953,908; of foreign dispatches, 703,061; in transit, 226,525; official, 90,213; receipts, 1,419,709 francs; expenses, 1,332,842 francs.

The postal traffic in 1893 was 47,621,000 internal and 12,726,000 international letters, 5,555,000 internal and 829,000 international post cards, 62,680,000 internal and 6,127 international newspapers and circulars, and 2,268,000 internal money letters, of the declared value of 489,136,000 francs, and 289,000 international, of the value of 41,490,

000 francs. The receipts were 9,245,600 kronor, and expenses 7,450,514 kronor.

The Army and Navy.—The strength of the active army in 1893 was as follows: Staff and general officers, 48; 56 battalions of infantry, comprising 27,455 men, including 1,332 officers; 50 squadrons of cavalry, numbering 5,260 men, including 233 officers; 5,267 field artillery, including 965 officers; 525 fortress artillery, including 33 officers; 9 companies of engineers, numbering 990 men, including 77 officers; 8 companies of train, numbering 772 men, including 66 officers; and 132 administration employees; total, 39,803 officers and men, with 6,852 horses. There were 132 officers on furlough and 985 in the reserve. The *landsturm* or national army numbers about 223,000 men, and the *landsvard* has 180,000 in its 5 classes.

The navy consists of 2 small armor-clad turret ships, 4 ironclad monitors, 9 armored gunboats, 3 corvettes, 14 gunboats, 1 torpedo cruiser, 6 first-class, 9 second-class, and 3 third-class torpedo boats, and 1 school ship. The personnel is 268 officers and 2,993 sailors.

Legislation.—The Agrarian agitation gained such headway that the Government, fearing that when the *Riksdag* met it would impose prohibitive duties on grain, determined to forestall its action, taking advantage of a dormant article of the Constitution that empowers the Government to alter the grain duties in emergency arising when the *Riksdag* is not sitting. On Jan. 5 a royal decree raised the import duty on rye and wheat from 1.25 krona to 2.15 krona, on malt from 1.50 krona to 4 krona, and on flour from 2.50 to 6.50 krona, making the rates the same as in the German tariff. This measure, denounced by the Agrarians and the Free Traders alike, had no immediate economical effect, except to enhance the value of the stocks remaining in the hands of the millers; but as a political expedient it succeeded, for the *Riksdag* was brought in the end to approve the schedule without alteration. The session was opened on Jan. 15. The subject of raising the grain duties was declared in the speech from the throne to be the prevention of importations for speculative purposes. The King intimated his willingness to compromise with the Norwegian Riksdag by admitting that the union of 1904 was susceptible of improvement. The principal business of the session was to authorize a considerable increase in the navy, a counter-measure to Norway's action, and menacing determination to build a navy, and to carry further the scheme for the insurance of workmen against old age, sickness, and accident. Petitions were placed on the first list. On May 8 a bill was passed in joint session for the purchase by the state of the Helsingborg and Gothenburg, Engelholm and Landskrona, and Malmö and Billundholm railroads.

In June Count Lewenhaupt resigned the Ministry of Foreign Affairs, and Count Ludvig W. A. Douglas took his place. The Minister of Finance was succeeded by H. Wersell.

Norway.—The legislative power is vested in the *Storting*, consisting 114 members, elected for three years, 38 by the towns and 76 by the rural districts. One-fourth of its members are chosen annually by the *Storting* to form the *Lagthing*, which has a veto power over the vote

of the Odelsthing, composed of the remaining three fourths of the members. The Council of State was composed in the beginning of 1895 as follows: Minister of State, Emil Stang; Education and Worship, Dr. Anton C. Bang; Justice, Ernst Motzfeldt; Interior, Peder Birch-Reichenwald; Public Works, Peder Nilsen; Finance and Customs, Ole Andreas Furu; Defense, Johannes Vinding Harbitz. The delegation at Stockholm consisted of Gregers W. W. Gram, Minister of State, with Dr. George Francis Hagerup and Lieut.-Col. Christian W. E. B. Olsson as associates.

Finances.—The revenue for the year ending June 30, 1894, was 53,624,900 kroner, including 577,800 kroner locally subscribed for railroad construction. Of the ordinary receipts, 21,021,900 kroner came from customs, 2,639,200 from direct taxation, 3,975,800 from the impost on spirits, 2,217,200 from the malt tax, 650,400 from the stamp duty on playing cards, 995,600 from judicial fees, 558,600 from the succession tax, 793,400 from domains and forests, 476,600 from mines, 1,636,800 from active capital, 3,290,200 from the post office, 1,297,200 from telegraphs, 7,727,900 from railroads, 1,778,200 from educational fees, 255,000 from prisons, 949,100 from hospitals, and 2,784,000 from miscellaneous sources. The expenditures amounted to 52,459,300 kroner, including 930,800 kroner for the construction of railroads. Of the ordinary expenditures, 352,700 kroner went for the civil list and appanages, 590,400 for the expenses of the Storting, 1,287,500 for the Council of State, 5,889,800 for education and worship, 5,560,000 for justice, police, and sanitary service, 7,674,800 for the interior, 9,906,400 for public works, 8,785,100 for financial expenses and the debt, 7,964,400 for the army, 3,644,500 for the navy, 642,300 for foreign relations, and 161,300 for accidental expenses.

The debt, which was contracted for productive public works, amounted on June 30, 1894, to 163,934,800 kroner, paying mostly 3 or 3½ per cent. interest. The railroads, active capital, and other assets of the Government were valued at 146,465,100 kroner.

Communications.—The railroads in 1894 had a total length of 1,055 miles.

The post office in 1894 carried 25,158,700 internal and 9,084,300 international letters and 36,975,100 internal and 4,384,100 international printed inclosures; the receipts were 3,409,477, and expenses 3,486,993 kroner.

The Government telegraph lines in 1894 had a total length of 5,137 miles, with 10,291 miles of wires, and the railroad telegraphs a length of 1,915 miles, with 1,905 miles of wires. The number of internal dispatches in 1894 was 1,100,749; of international dispatches, 596,184; service dispatches, 11,163; receipts, 1,333,338 kroner; expenses, 1,629,351 kroner.

Commerce.—The imports of merchandise in 1894 were valued at 205,990,000 kroner, and exports at 131,905,000 kroner. The principal imports and their values were: Cereals, 31,500,000; groceries, 24,300,000; coal, 14,600,000; tissues, 29,800,000; oils, 10,500,000; animals and provisions, 14,100,000; metals, 7,800,000; hides and leather, 6,100,000; textile materials, 5,900,000 kroner. The values of the chief exports

were: Animals and animal products, 45,300,000; timber, 28,000,000; wood manufactures, 18,400,000; skins and leather, 7,000,000; oils, 6,800,000; tissues, 5,700,000 kroner. The foreign commerce was distributed in 1894 as follows, values being given in kroner:

COUNTRIES.	Imports.	Exports.
Great Britain.....	57,546,000	45,421,000
Germany.....	56,294,000	15,226,000
Sweden.....	29,438,000	21,221,000
Russia and Finland.....	19,549,000	4,287,000
Denmark.....	9,088,000	4,438,000
France.....	8,692,000	7,805,000
Holland.....	8,122,000	6,470,000
Belgium.....	7,942,000	4,481,000
Spain.....	770,000	12,878,000
Portugal.....	681,000	1,804,000
Italy.....	1,480,000	3,708,000
United States.....	8,926,000	1,125,000
Other countries.....	2,527,000	3,560,000
Total.....	205,990,000	131,905,000

Navigation.—There were entered in 1893 at the ports of Norway 6,209 Norwegian vessels, of 1,876,195 tons, and 5,342 foreign vessels, of 970,753 tons; and there were cleared 6,383 Norwegian vessels, of 1,991,640 tons, and 5,316 foreign vessels, of 966,792 tons. The total number entered was 11,551, of 2,846,948 tons, of which 5,639, of 1,792,328 tons, were with cargoes; of the total number of 11,699, of 2,953,482 tons, that were cleared, 10,239, of 2,361,502 tons, carried cargoes.

The merchant marine on Jan. 1, 1894, numbered 6,702 sailing vessels, of 1,452,276 registered tons, and 811 steamers, of 237,135 tons.

The Army and Navy.—Military service was declared obligatory by the law of 1885 from the age of twenty-three for five years in the active army, but actual service with the colors is confined to a course of instruction, lasting in the first year seventy days for cavalry and field artillery, fifty days for engineers, forty-two days for infantry, mountain, and fortress artillery, and sanitary troops, and eighteen days for the train, followed by twelve days of exercises with the first classes of the Landwehr. The artillery, cavalry, and engineers are called out for twenty-four days of exercises in the next three successive years, and the other troops for two years only. The peace effective of the active army is about 1,700 officers and instructors and 18,000 men; for war it can be doubled by drafts from the Landwehr.

The naval force consists of 4 ironclad monitors, 1 corvette, 3 first-class, 12 second-class, and 16 third-class gunboats, and 11 first-class and 2 second-class torpedo boats. There are being built 2 armored-turret ships, 1 first-class gunboat, 1 torpedo cruiser, and 7 torpedo boats. The personnel of the navy consists of 97 officers, 30 cadets, and 454 sailors and employees.

The Conflict with Sweden.—Just before the assembling of the newly elected Storting the King transferred his residence to Christiania. The Conservative ministers who had carried on the administrative business for nearly two years without a majority placed their resignations in his hands. The Swedish Government was inclined to accede to the establishment of a separate Norwegian consular service, as already enacted by the Storting, but only on condition

that the common diplomacy should be preserved. King Oscar offered to the Radical Left the option of forming a ministry upon the understanding that the consular question should be submitted to the joint Council of State after negotiations with Sweden regarding the dissolution of the existing consular system and the question of foreign relations. Two years before he had ruled that the breaking up of the joint consular system could not be carried through by Norway independently, as a matter of purely internal politics. The Left declined to enter into negotiations with Sweden until they could be conducted by a minister representing a majority of the Storting. The Storting was called to an extraordinary session on Feb. 1, and on Feb. 19 passed into the ordinary session. No solution of the political crisis having been reached, the Stang ministry remained provisionally in office. The introduction of compulsory military service in the northern provinces and the expenditure of large additional sums for the completion of the military defenses were proposed in the speech from the throne. To balance the increase in the national expenditure a stamp tax was declared to be necessary. Having failed to come to an agreement with the Radical leaders, the King, on Feb. 27, requested the Conservative ministers to withdraw their resignations, and when they declined he requested Jacob Sverdrup, of the Moderate Left, to form a ministry, but he refused to accept the mission. Ex-Minister Thorne likewise refused. The King favored the reorganization of the Ministry of Foreign Affairs on a strictly common basis, with a minister who may be either a Swede or a Norwegian and who shall be responsible to a joint delegation of the Riksdag and the Storting. The Stang ministry was induced to continue in office after the failure, in the beginning of April, of Herr Michelet, a member of the Right, to obtain the co-operation of the Radicals in a coalition Ministry of Affairs. The Swedish Riksdag threatened to abrogate the commercial treaty with Norway, and the Extreme Radicals became more violent as the deadlock continued. The temperate men of the party saw the prospect of an acceptable revision of the act of union improved by the intervention of the King. On June 7 the Storting resolved to enter into negotiations with Sweden by a vote of 90 against 24. The King called upon the Radical leader Engelhart, the mover of the resolution, to form a Cabinet representing the majority. Herr Engelhart, however, declined to undertake the task unless he were allowed to select his colleagues not only from among the 35 Radicals who voted for his motion, but also from among the Extreme Radicals who had opposed it. On June 17 King Oscar asked Jacob Bonnevie, a Conservative ex-minister, to form a compromise ministry, but he also failed. The diplomatic and consular appropriations were voted by the Storting in the latter part of June with conditions appended that the Swedish Government declined to accept. The civil list, which the Storting reduced in 1893 from 368,000 to 256,000 kroner, and the allowance to the Crown Prince, which was cut down from 80,000 to 30,000 kroner, were restored on the demand of the King, who contended that it was

a violation of the Constitution to reduce the royal allowance. On July 21 Herr Thorne attempted to form a coalition Cabinet without success. On July 25 the Storting voted 2,000,000 kroner for 2 ironclads and 4,000,000 kroner for 3 torpedo boats and the remodeling and armament of the 4 monitors already possessed by Norway. Negotiations were begun between the Swedish and Norwegian governments and proceeded while the extremists of both countries exchanged threats of war. The Cabinet crisis did not end before Oct. 14, when a coalition Cabinet was formed, made up as follows: Minister of State, Dr. G. F. Hagerup, who took charge of the Department of Justice and Police; Minister of Public Worship and Education, Dr. Jacob L. R. Sverdrup; Minister of the Interior, T. de W. Engelhart; Minister of Public Works, P. Nibm; Minister of Finance and Customs, R. Kildal; Minister of National Defense, Lieut.-Col. C. W. E. B. Olsson; Secretary of the Department of Religion, F. Stang-Land; Delegation at Stockholm, G. W. Gram, Minister, and R. M. Haugland and H. Simdal, Counselors of State. A joint commission was appointed by the two governments in November to discover an amicable solution of the difficulties connected with the union. Of the Norwegian commissioners, 2 were taken from the Right, 3 belonged to the Left, and 1 was a Moderate.

SWITZERLAND, a federal republic in central Europe, consisting of 27 cantons or independent half cantons. The Federal Assembly is composed of the Bundesrath, consisting of 147 members elected for three years by direct universal suffrage, and the Ständerath, containing 2 members from each canton or half canton. The executive authority is exercised by the Bundesrath, consisting of 7 members chosen by the Federal Assembly, one of whom is elected annually in December to serve as President of the Federation for the coming year, and another to serve as Vice-President. The Federal Council in 1895 was composed as follows: President, J. Zemp, of Lucerne; Chief of the Department of Posts and Railroads, Vice-President, A. Lachenal, of Geneva; Chief of the Department of Foreign Affairs and Commerce; Chief of the Department of Military Affairs; Emil Frey, of Basel-Land; Chief of the Department of Justice and Police, Lieut.-Col. A. von Wattenwyl, of Bern; Chief of the Department of the Interior, E. Ruffy, of Vaud; Chief of the Department of Industry and Agriculture & Decker, of Thurgau; Chief of the Department of Finance and Customs, W. Hauser, of Zurich. A. Lachenal was elected President and A. Decker Vice-President for 1896 on Dec. 12, 1895.

Area and Population.—The area of Switzerland is 15,916 square miles. The population in June, 1904, was estimated to be 2,595,497. The number of marriages in 1894 was 11,423; of births, 87,478; of deaths, 60,317; excess of births, 27,161. The city of Zurich in the middle of 1895 had 124,549 inhabitants; Geneva, 80,111; Basel, 78,980; Bern, 49,328.

Finances.—The Federal revenue in 1894 was \$1,047,312 francs, of which \$1,000,000 came from customs, 2,554,194 from the salt, 180,501 from bank notes, 478,291 from real property, 1,475,

283 from invested capital, 25,726,178 from posts, 6,019,352 from telegraphs and telephones, 179,045 from railroads, 2,353,122 from military arsenals, 47,377 from the general administration, 330,058 from the political department, 6,888 from justice and police, 174,601 from industry and agriculture, and 21,576 from other sources. The total expenditures were 83,675,812 francs, of which 4,013,267 francs were for interest and sinking fund of the debt, 1,038,020 for the general administration, 955,693 for the political department, 9,633,476 for the Interior Department, 153,806 for justice and police, 24,780,828 for the Military Department, 9,984,187 for finance and customs, 3,161,946 for industry and agriculture, 29,901,138 for posts and railroads, and 52,651 for unforeseen expenses.

The debt of the Federation is 85,203,586 francs; the active assets are 156,326,189 francs.

Commerce.—The special commerce with foreign countries in 1894 is shown in the following table, the values being given in francs:

COUNTRIES.	Imports.	Exports.
Germany	242,525,000	157,110,000
France	110,292,000	73,044,000
Italy	143,824,000	87,933,000
Austria-Hungary	80,256,000	89,943,000
Great Britain	43,140,000	117,589,000
Netherlands	8,025,000	4,142,000
Belgium	23,085,000	11,731,000
Spain	11,236,000	11,702,000
Russia	55,735,000	22,416,000
Other European countries	6,824,000	20,019,000
United States	85,054,000	71,840,000
Other American countries	23,042,000	18,706,000
Asia	31,233,000	26,330,000
Africa	12,281,000	5,511,000
Australia	4,061,000	1,797,000
Without indication		2,395,000
Total	825,883,000	621,199,000

The imports of coin and bullion, which are not included in the above statement, amounted to 54,962,000 francs, and the exports to 51,805,000 francs. The values, in francs, of the principal imports were: Silk, 102,400,000; grain and flour, 80,000,000; animals, 71,700,000; coal, 38,300,000; woollens, 37,500,000; chemicals, 28,500,000; cotton, 27,200,000; iron, 27,100,000; wine, 23,400,000; machines and vehicles, 21,300,000; sugar, 19,200,000; cotton goods, 18,800,000; iron goods, 16,800,000; coffee, 16,600,000; timber, 14,600,000; barley, malt, and hops, 11,700,000; leather, 11,100,000; wool, 9,300,000; books, etc., 9,200,000; tobacco, 9,000,000; silks, 8,900,000. The values of the principal exports, in francs, were: Silks, 118,900,000; cottons, 102,800,000; watches, 85,900,000; cheese, 37,700,000; raw silk, 34,800,000; silk yarn, 29,800,000; machines and vehicles, 26,700,000; chemicals, 21,300,000; milk, 19,600,000; cotton yarn, 19,300,000; animals, 15,600,000; woollen yarn, 8,700,000; straw goods, 8,400,000. A new commercial treaty with France, terminating the war of tariffs, went into force on Aug. 19, 1895.

Communications.—Switzerland had 2,220 miles of railroads on Jan. 1, 1894. The post office in 1894 carried 76,985,000 internal and 32,044,000 international letters, 15,206,000 internal and 9,109,000 international postal cards, and 24,860,000 internal and 18,445,000 international circulars and book packets, and transmitted 3,906,000 internal postal orders for 424,949,000 francs and 778,000 international ones for 35,689,000 francs. The state telegraph lines in 1894 had a total length of 4,515 miles, with 12,258 miles of wire. The number of messages sent was 3,780,698, of which 1,818,827 were internal, 1,301,376 international, 526,537 in transit, and 133,958 official.

T

TENNESSEE, a Southern State, admitted to the Union June 1, 1796. The population, according to each decennial census since admission, was 105,602 in 1800; 261,727 in 1810; 422,771 in 1820; 681,904 in 1830; 829,210 in 1840; 1,002,717 in 1850; 1,109,801 in 1860; 1,258,520 in 1870; 1,542,350 in 1880; and 1,767,518 in 1890. Capital, Nashville.

Government.—The following were the State officers during the year: Governor, Peter Turney; Democrat; Secretary of State, William S. Morgan; Treasurer, Edward B. Craig; Comptroller, James A. Harris; Attorney-General, G. W. Pickle; Adjutant General, John A. Fite, succeeded in May by Charles Sykes; Superintendent of Public Instruction, Frank M. Smith, succeeded by S. G. Galbreath; Commissioner of Agriculture, Statistics, and Mines, T. F. P. Allison; Commissioner of Labor, F. P. Clute; State Geologist, J. M. Safford; Chief Justice of the Supreme Court, D. L. Snodgrass; Associate Justices, W. C. Caldwell, John S. Wilkes, W. K. McAllister, and W. D. Beard; Court of Chancery Appeals Justices, M. M. Neil, S. P. Wilson, R. M. Barton, Jr.—all Democrats.

Finances.—The total valuation of taxable property in the State in 1895 was \$316,061,613.

The value of town lots was placed at \$111,906,412.

The legislative committee appointed to examine the treasury accounts reported that the actual floating debt of the State Dec. 20, 1894, was \$7,275.86. The report said further: "We find that Comptroller Harris did, on May 2, 1894, call in the entire amount of outstanding 5s and 6s, aggregating \$1,011,900, which caused all further interest on this amount to cease after July 1, 1894, thereby resulting in a great saving to the State. The Comptroller estimating that the \$1,011,900 could easily be paid out of the proceeds of the sale of the \$1,000,000 redemption bonds and the remainder could readily be redeemed out of the surplus in the treasury, which has been done. The balance in the treasury in May was \$1,043,372.

The University.—The total number of students this year was 317. The medical department numbered 186 at the spring term, and graduated 59, of whom 15 were students in dentistry. The university won the highest award at the Atlanta Exposition for the best collective exhibit of university work. It now offers free tuition to all students of proper age and character who pass the required examinations.

The Penitentiary.—Charges of mismanagement in regard to the contracts for building the Penitentiary having been made, an investigation was demanded, and a legislative committee was appointed, which, after a thorough investigation, made a report sustaining most of the charges. It was found that there had been fraud and corruption in the sale of lands to the State for the new prison and in the letting of the contracts for building it. The evidence showed corruption on the part of M. L. McDowell, one of the building and purchasing committee, whose resignation was at once demanded by the Governor. Others implicated in the frauds were C. C. Estill, State Railroad Assessor; John A. Fite, Adjutant General; E. L. Laurent, supervising architect; and W. C. Smith, the architect who prepared the plans. The commissioners were wholly unfamiliar with the duties required of them. The greatest fraud appears to have been in the letting of the building contract. The State officers above named were forced to resign.

The report on the condition of the main prison at Nashville was very unfavorable; dirt, squalor, illness, mismanagement, and suspicion of immorality were among the conditions reported.

Contracts for the new buildings were signed in December. The cost is not to exceed \$200,000. Bids were received for leases of convict labor, but none had been accepted at the close of the year. There are about 1,600 State prisoners, scattered as follows: Main prison, 605; Tracy City, 425; Brushy Mountain, 350; Coal Creek, 100; new prison, 50; and quarry, 50. The stockade at Brushy Mountain will accommodate between 300 and 600 prisoners. On the recommendation of the Penitentiary Committee, the Governor pardoned 49 convicts in April, some of whom were women, others boys, others invalids, and in one or two instances the pardon was the reward of good conduct.

The Centennial Exposition.—Although the Legislature made no appropriation, progress has been made in the preparations for the exposition to celebrate the hundredth anniversary of Tennessee's statehood. Large subscriptions have been made, officers chosen, a site selected in the outskirts of Nashville, comprising 320 acres, some of the building designs accepted, and some contracts let. The corner stone of the Fine Arts Building was laid in October. It is expected that the exhibition will open Sept. 1, 1896.

Wantauga Tree.—The one hundred and fifth anniversary of the acceptance of the territory of Tennessee was celebrated April 2 by the planting on the Capitol grounds of a tree from the old fort at Wantauga, the first white settlement west of the Alleghenies.

The Election of Governor.—The returns of the election of 1894 gave a plurality of 748 to H. C. Evans, the Republican candidate for Governor. The Democrats claimed that this result was due to fraud (see "Annual Cyclopaedia" for 1894, page 739), and Gov. Turney sent a petition and address to the Legislature asking for an investigation. The chairman of the Republican State Committee also sent an address stating the legal position taken by his party, which was that, to carry out the provisions of the Constitu-

tion, the candidate shown on the face of the returns to be elected should be seated as Governor; when this had been done, and not till then, could a contest take place; till then there could be no parties and no subject-matter of contest, no controversy requiring investigation and decision could exist; that the Constitution required the contest to be decided by the Assembly and not by the courts, and "in such manner as is prescribed by law"; that there could therefore be no contest until a law should be passed, and attention was called to the distinction between a law and a resolution; and the communication said further:

But the publication of the returns and the seating of the Governor show that he is disposed with or postponed because there is no law defining the mode of contest, not by any law which may be passed on the subject, nor by any statute which may be introduced under such law, nor by any statutory proceeding, nor on any cause at present whatever. The contest comes after the seating of the Governor-elect. The Governor holds his office for two years, and until his successor shall be elected and qualified. But his term is computed from Jan. 12 next after the election. The person who on the publication of the returns shall have the highest number of votes "shall be Governor." The title to the office is in him; his *prima facie* right is immediate and complete. The Legislature may provide a remedy for a contest, but it must be carried on with the Governor-elect qualified and seated. The contestant to the office whom the returns show not to have been elected becomes the contestant; the fact that he happens to have been Governor for the term just expired gives him no right to the office for any part of the new term, and no more enables him to trace possession of the office pending the contest than his claim to the office would enable him to be declared invalid if he had not been the incumbent. By conferring on the Legislature the right to prescribe the manner of making the contest, the Constitution did not destroy its previous declaration that the person having the highest number of votes shall be Governor. He is Governor, subject to be deprived of his office by the determination of the contest, for which the Legislature may provide by law. His right is immediate and vested, and superior to that of any contestant or incumbent. The contestant, wherever he may be, at whatever his position, must await the result of the contest. To hold otherwise would be to afford a reward for frivolous or corrupt contests and to enable an incumbent to continue himself in office merely by making a contest regardless of its issue.

The Democrats did not take this view of the question, and refused to wait Mr. Evans till after the investigation had been made.

Their position was:

As the Constitution provides no particular time for the inauguration of a Governor-elect, but merely provides that he shall be inaugurated during the first session of the Legislature after the election, and that the sitting Governor shall hold his office until his successor is elected and qualified, a law prescribing the manner of the contest should be determined during the present session of the Legislature, and the candidate who received the plurality of the legal votes at the November election should then be inaugurated.

The Democrats majority decided upon this latter course, three bills having been introduced prescribing the method of procedure, and a resolution passed postponing the opening of the returns, and also postponing the inauguration until after investigation. One of the bills intro-

tioned was passed, and Mr. Evans sent in a protest against the act as being unconstitutional and void. Soon after the returns were opened he took the oath as Governor before a justice of the peace at the State Library, Feb. 6, in the presence of several State officials and about 150 members and visitors, claiming that, as the returns showed his election, it was his right and duty to take the oath. Having been sworn to and subscribed, it was offered to the Secretary of State to be placed on file, but he refused to receive it.

The vote was opened in joint convention, and the objections of Turney and Evans were made to the returns of the various counties, Mr. Evans's objections being made under protest against the manner of proceeding. Both contestants objected to the returns from 5 counties; Turney objected to 29 in addition, and Evans to 40 others; those of 22 were not objected to. The Democrats charged frauds in the eastern counties mainly, the Republicans in the middle and western. The former alleged that in the 29 counties 29,733 votes were cast without the payment of poll taxes, of which 22,774 votes were cast for Evans and 6,959 votes for Turney. It was estimated that 24 per cent. should be deducted for the votes of citizens who were over age or otherwise legally exempt from the payment of poll taxes, which would leave Evans credited with 17,208 and Turney with 5,389 illegal votes on the face of the returns. The total illegal vote on the face of the returns on account of violations of the poll-tax law was estimated at 22,597. It was also charged that convicts had been allowed to vote in Anderson County; that votes had been openly bought in Campbell County; that in Cooke County no legal returns whatever were made; that in Greene County the box was illegally opened before the time for closing the polls; and other irregularities were named.

The answer and counter-charges alleged that 63,596 votes cast for Turney and 31,796 cast for Evans were affected by illegalities and frauds. There was an answer to this document, making specific denials.

The bill that had been passed provided for the appointment of a committee of 5 Senators and 7 Representatives to take proof concerning all alleged frauds and violations of election laws in any part of the State, and to report within forty days to the joint convention, which should then try the case upon the report and proof submitted.

Five of the 12 appointed to the committee were Republicans. The committee heard arguments in reference to the rules for admitting evidence, etc., and pleading in regard to the various counties proposed for investigation. It was alleged that the rulings of the committee resulted in fuller investigation of the eastern counties than of the middle and western, some of the latter having been thrown out of the list. The committee was divided into 4 subcommittees, to each of which a part of the counties to be investigated was assigned; and these subcommittees went through the State examining records and taking testimony. The Legislature took a recess of about forty-five days during their absence, and reconvened April 2. The

majority report, signed by the 7 Democratic members of the committee was submitted April 27, and showed a plurality of 2,358 for Turney. The committee had cast out 22,389 votes as illegal, of which 12,656 were for Evans and 9,733 for Turney, making a net loss of 2,923 for Evans. His plurality was at first reported as 748, but errors found in tally sheets had reduced it by nearly 200. The minority report declared that the committee exceeded its authority in deciding some charges not specific; that it did not find according to the law and the facts, and that it ruled in opposite ways as Turney's interest required. Arguments were heard before the Legislature in joint convention, and the majority report was adopted by a vote of 70 to 57. Two were excused from voting, one of whom gave as the reason that, while his constituents desired him to support the majority report, he could not conscientiously do so, believing that the investigation had not been full and thorough. Gov. Turney was declared elected, and was inaugurated May 8.

Legislative Session.—The Legislature convened Jan. 7, and adjourned May 14. A recess of about forty-five days was taken, in order to allow the investigation of alleged election frauds to be made. It reconvened April 2, and took another recess of ten days—April 12-22—for the purpose of giving time for the election and other committees to finish their work. An extra session was called by the Governor, beginning May 30, and adjourned June 17.

Ernest Pillow was chosen Speaker of the Senate, and John A. Tipton Speaker of the House. The Democrats had 20 Senators and 60 members of the lower house; the Republicans, 10 Senators and 32 in the lower house; the Populists, 3 and 7, respectively. Isham G. Harris was re-elected United States Senator. The Republican candidate was E. J. Sanford, and A. L. Mims was voted for by the Populists.

A Court of Chancery Appeals was created for the purpose of assisting the Supreme Court to finish the cases on hand and to try all the cases on the docket at each term hereafter. It is to consist of 3 judges.

In order to restrict coroners' inquests to cases where they are actually needed, an act was passed requiring certain evidence in writing before such inquest can be held establishing a probability that death resulted from violence or foul means.

Superintendents of schools in counties of 30,000 and over were forbidden teaching or taking contracts for school work, and a law was passed to provide for the better qualification of county superintendents.

The game laws were amended; it was made unlawful for any person to ship from Gibson County any quail at any season of the year, and a misdemeanor to hunt any quail or partridge in Grainger or Hamblen County from April 1 to Oct. 1; laws were made to protect deer in certain counties, and to protect game in Warren County. Laws were also made for the better protection of fish.

The so-called no-fence law was made to apply to Davidson, Knox, Shelby, Gibson, and Madison Counties, and it was provided that other counties may adopt the law by a majority vote. It

is designed to relieve farmers of the expense of enclosing their fields, and involves the preventing of live stock from roaming at large.

The boundary lines of many counties were changed. Certain cities and counties were authorized to fund their floating debts. The following cities were incorporated: Dover, Stewart County; South Fulton, Obion County; Dayton and Spring City, Rhea County; Jamestown, Fentress County; Camden, Benton County; and Binghampton, Shelby County. Some charters of cities were amended, and those of the following were repealed: Oakdale, Morgan County; Harrogate and Bacchus, Claiborne County; Erwin, Union County; Clifton, Wayne County; and Trimble, Dyer County. The acts incorporating White Pine, Jefferson County, and Allenton were repealed, and an act was passed repealing the charter of Rockwood, Roane County, and reincorporating it.

Other acts of the regular session were:

To cede to the United States jurisdiction over certain lands in Hamilton, Hardin, and McNairy Counties, including the battlefields of Shiloh, to establish a national park.

To establish a system of reformatory institutions for youth.

To authorize Memphis to issue \$3,000,000 of bonds to refund old debts.

To provide for the organization and support of battle-field associations.

To provide for labeling, stamping, or marking oleomargarine, butterine, and imitation butter, and to provide against coloring it.

To create a Commission of Public Printing.

To authorize municipal corporations of above 2,000 inhabitants to establish and maintain a high-grade school.

To provide that no life, fire, marine, accident, or other insurance company having its capital stock wholly outside of the State of Tennessee shall be required to pay any tax on its capital stock for doing business in this State.

To appropriate \$10,000 for a monument to Tennessee soldiers in Chickamauga National Park.

To prevent the spreading of contagious or infectious diseases among domestic animals.

To prevent the attachment or garnishment of future salary or wages of any employee.

To prevent special assignments, and to secure to creditors a *pro rata* distribution of the property estates and assets of debtors.

To provide for the teaching of the effect of alcoholic drinks and narcotics and smoking cigarettes in the public schools.

To create a Board of State Charities.

To change the name of the Mossy Creek Baptist College to the Carson and Newman College.

To make unbelievers competent witnesses.

To authorize the United States to acquire lands for a sub-cultural station.

To regulate the business of insurance other than life and casualty insurance upon the assessment plan.

To have copied the registers of the Tennessee soldiers in the Confederate army, and appropriating \$4,000 therefor.

Appropriating \$17,000 for the maintenance of the Confederate Soldiers' Home for the next two years.

Resolutions were adopted as follow:

To memorialize Congress to enact legislation that will provide for the free and unlimited coinage of silver and gold at the ratio of 16 to 1.

To provide for the settlement of the claims between the State and the United States growing out of the seizure of railways by the Government during the war.

A commission was appointed to prepare a bill for revenue, and the following special commissions were appointed: To investigate alleged irregularities in the management of the Penitentiary; to examine the offices of the Comptroller and the Treasurer; to examine the office of the Secretary of State; to examine into the expenditures of the Department of Agriculture and the Bureau of Labor; to investigate the State printing accounts; to examine into the cost of criminal prosecutions; and to devise a plan for reducing it. A commission on insurance and building and loan associations also was provided for.

The Comptroller and the Treasurer were re-elected, and most of the other State officials who are appointed or confirmed by the Legislature.

In the call for the extra session, 4 subjects were named for legislative action: The appropriations for the support of the State Government and institutions, and other public purposes; taxation and revenue; regulation of State banks; establishment of a lease district; provision for making registration less frequent; the providing of a main prison and stockade for the State's convicts.

The revenue bill prepared by the commission, which had passed the Senate at the regular session after various changes, was enacted into a law. It reduced the State tax from 40 cents on the \$100 to 25, of which 20 cents is for State and 15 cents for school purposes. The county courts are empowered to levy a county tax not exceeding 20 cents on every \$100, exclusive of the tax for public roads and schools and interest on county debts, except as otherwise provided in the bill. A long list of privilege taxes follows, the highest of which is \$10,000 a year on railroad companies not paying ad valorem tax to the State and operating or controlling 400 miles or more of road in the State; and \$5,000 on those operating from 100 to 400. The highest tax on express companies is \$2,000. A large number of the privilege taxes are reductions, in some cases by one half.

The inheritance tax is omitted, and the insurance taxes are unchanged. Fuel sellers are taxed \$250, and elevator companies \$50, except in places of fewer than 2,000 inhabitants, where the tax is but \$10.

The action taken in reference to registration provided that a general registration shall be held next August in all cities, towns, and districts subject to the registration laws; after that date there will be registration every two years, except in civil districts of 2,000 population not included in counties wholly subject to registration, and in those districts registration will be held every four years. Once every year, in all districts subject to the registration, there will be three days' registration to allow all who have failed to register to do so.

An appropriation bill and a lease bill were passed.

An important part of the work was that providing for the Penitentiary. Both political parties were committed to the abolition of the lease system, and the current lease was to expire Jan. 1, 1906. An quarters could not be provided for all the prisoners by that time, it seemed nec-

sary to lease a part at least temporarily, and the two houses almost came to a deadlock. The bill as passed calls for the building of a new prison, to cost not more than \$350,000, on the Cockrill farm. It calls for 820 cells in the main prison, and provides for 1,000 convicts at the Brushy Mountain mines, appropriating \$40,000 for building stockades there and opening up the mines. It provides for 3 prison inspectors.

Conventions.—A "sound-money" convention assembled at Memphis, May 23, and delegates were present from every Southern State. The convention was addressed by the Secretary of the National Treasury, and adopted a platform favoring monometallism.

Another convention was held in the same city, June 12-13, in the interest of silver coinage. A large number of those who spoke favored placing the silver question above party allegiance, and there was some prospect of a bolt on that account; but the resolutions omitted all reference to party lines, advocating free coinage and attributing the hard times to the demonetization of silver.

A wheat convention was held at Nashville, Sept. 10-11, attended by about 60 wheat growers and millers, from all parts of the State.

The National Park.—The dedication of the Chattanooga and Chickamauga National Park, Sept. 18-20, was attended by a vast crowd, estimated at 40,000, among them great numbers of veterans of both armies. Of the 10 square miles constituting the area of the park, over 5,000 acres are forest and about 1,000 acres open farms. A central driveway, passing through and overlooking all the heavy fighting ground, has been built 20 miles long. Forty-two miles of the roads of the battles have been reopened and improved in the most substantial and enduring manner, and new roads have been closed up. Many of the minor roads have also been cut out and graded, so that there are now about 60 miles of driveways in the park, all of them along the roads of the war. The removal of underbrush and the clearing out of the new growth of timber has opened the forest so that carriages can drive through it in all directions, and the appearance now is like that of an immense area of forest pasture in the blue-grass region.

The Chickamauga portion of the park is connected with the Chattanooga end of it by national driveways. Within the park the Government has set up 400 historical tablets, and will set up 1,000 more, each 3 by 4 feet, consisting of cast-iron plates, glazed black, fastened to iron posts set in concrete. On these tablets in embossed white letters are set forth briefly and impartially the historic details of the six battles—Chickamauga, Missionary Ridge, Lookout Mountain, Orchard Knob, Wauhatchie, and Brown's Ferry. They also mark the positions of army headquarters, corps, divisions, and brigades, both National and Confederate, and the parts taken by each organization are stated concisely, without censure and without praise. The Government has also erected 9 handsome granite monuments, all different, one for each of the organizations of regular army troops engaged in the battles. It has also built, on the spots where they fell, 8 pyramidal monuments of novel design, each 10 feet high, constructed of 8-inch

shells, in honor of 4 general National officers and 4 Confederate officers, killed in action.

In addition, the Government has built 5 observation towers, 70 feet high, 2 on Missionary Ridge, and 3 on Chickamauga field. Finally, it has marked the most important fighting positions occupied by each of the 35 National batteries and 39 Confederate batteries engaged in the battles, by 400 mounted cannon of the types and appearance then used. Besides the guns themselves the battery positions are described on tablets. The lines of earthworks used by the contending armies have been found also, and are being carefully restored.

The States have set up 171 monuments in memory of the action of their regiments.

Shiloh.—Next in interest to the dedication of the National Park, was the reunion of veterans on the field of Shiloh on the thirty-third anniversary of the battle, April 6.

TEXAS, a Southern State, admitted to the Union Dec. 29, 1845; area, 265,780 square miles. Population, according to each decennial census since admission, 212,592 in 1850; 604,215 in 1860; 818,759 in 1870; 1,591,749 in 1880; and 2,235,523 in 1890. Capital, Austin.

Government.—The following were the State officers during the year: Governor, Charles A. Culberson, Democrat; Lieutenant Governor, George T. Jester; Secretary of State, Allison Mayfield; Treasurer, W. B. Wortham; Comptroller, R. W. Finley; Superintendent of Public Instruction, James M. Carlisle; Commissioner of General Land Office, A. J. Baker; Commissioner of Agriculture, Insurance, Statistics, and History, A. J. Rose; Adjutant General, W. H. Mabry; Attorney-General, Martin M. Crane; Chief Justice of the Supreme Court, Reuben R. Guines; Associate Justices, Leroy G. Denman and Thomas J. Brown; Clerk, Charles S. Morse.

Finances.—The report of the Comptroller for the year ending Aug. 31, 1895, showed these figures: Receipts, \$2,086,578.20; amount of warrants issued, \$2,329,414.56; retrenchment in expenses of the various departments at the capital, \$78,293.50; poll tax assessed, \$711,168.50; *ad valorem* tax assessed, \$3,874,070.40; occupation taxes, \$792,770.25; total acres of land assessed, 133,265,147; valuation of lands, \$412,311,585; valuation of town lots, \$186,815,838; valuation of live stock, \$75,418,674; valuation of railroads, \$70,420,925; and assessed value of all other property, \$115,943,545; total tax assessed, \$4,585,238.90; and net reduction of assessed values from the total of the previous year, \$4,210,422. The expenses of the State were reduced about \$275,000 per annum, and the extraordinary increase in the taxes was due to deficiencies in revenue, estimated at \$1,800,000. The State debt aggregated \$3,992,030, of which the permanent school fund held bonds amounting to \$2,162,600; the University fund, \$567,540; the Agricultural and Mechanical College, \$209,000; the State Lunatic Asylum, \$111,700; the Blind Asylum, \$111,500; the Deaf and Dumb Asylum, \$61,000; and the Orphan Asylum, \$9,200—leaving \$750,490 in the hands of individuals.

Legislative Session.—The Legislature met in regular biennial session on Jan. 8, and Governor Culberson was inaugurated on the following day. The message of the retiring Governor

treated of the general condition of the State, and that of the incoming one was a plea for the exercise of strict economy in the administration of the government. The session was extended beyond the usual time, and an uncommonly large number of bills was considered. Among the bills that became laws were those to set apart the 22d day of February as "Arbor Day"; to transfer the Confederate Home from private to State management; to assess national bank notes and United States Treasury notes; to encourage irrigation; to provide for the construction and maintenance of ditches, drains, and water courses, and for the improvement and enlargement of the natural drainage of the several counties; to authorize cities and towns of 10,000 inhabitants or less to abolish their corporate existence; to incorporate the city of Sherman; to establish an arbitration commission by which labor grievances may be adjusted; to create life and accident insurance companies; to adopt and publish the revised civil statutes, the penal code, and the code of civil procedure; and a large number to increase the revenues of the State and to quiet titles to land.

Education.—The school census of 1895 showed 547,904 white pupils and 170,901 colored, an increase in the year of 25,153, principally in the northern and middle counties. In May the Superintendent of Public Instruction rendered a decision, on appeal, denying the right of sectarian schools to partake of the benefits of any distribution of the State Free-school fund toward paying the teachers of such schools where the children are numbered among free-school pupils and taught by sectarian teachers. Details from the reports of the various institutions for the year ending Aug. 31, 1894, reported in 1895, included the following: Total expenditures on account of the public schools, \$3,504,257, of which \$2,892,296 was wages to teachers; number of teachers, 12,462; number of high schools, 70; number of endowed academies, seminaries, and other secondary schools, 42, with 180 instructors and 3,574 students; colleges for women, 4, with 42 instructors and 636 students; and universities and colleges of liberal arts, 11, with 165 professors and instructors, 3,513 students in all departments, and 27,438 volumes in the libraries. The State University had 46 professors and instructors, 700 students, 13,000 volumes in its libraries, \$580,000 in productive funds, and a total income of \$70,000. The State Agricultural and Mechanical College had 24 professors and instructors, 293 students, 211 acres under cultivation, farm lands valued at \$24,160, buildings and equipments valued at \$33,120, receipts \$102,780, and expenditures \$107,280; and the State Normal School, at Prairie View, where similar instruction is given to colored youth, had 19 instructors, 184 students, property valued at \$18,150, and receipts and expenditures of \$28,133. The Texas Deaf and Dumb Asylum and the Texas Deaf, Dumb, and Blind Asylum for Colored Youth, both in Austin, had 18 instructors, 265 inmates, grounds and buildings valued at \$257,000, receipts \$58,320, and expenditures \$48,457; and the Texas Institution for the Education of the Blind, at Austin, had 15 instructors, 171 inmates, grounds and buildings valued at \$135,000, receipts \$42,930, and

expenditures \$42,287. The State House of Correction and Reformatory, at Gasterbury, had 21 assistants, 294 inmates, grounds and buildings valued at \$71,000, and expenditures \$4,200.

Railroads.—The Railroad Commission reported 9,290.70 miles of main line of railroad open to traffic on June 30, 1895. All the construction in the preceding four years was in counties already fully provided with railroad facilities, and it was claimed that not a mile that was built in that period was really necessary. Forty-one counties had a total of 4,809.50 miles, 125 others had an average of 36 miles each, and 81 had none whatever. In its inaugural message, June 16, Gov. Callahan estimated the company valuation of all railroads in the State at \$75,000,000, and the taxable valuation at \$75,000,000.

Agriculture.—The United States Department of Agriculture reported as follows on the principal crops of 1895: Corn, 4,067,882 acres, 107,265,565 bushels, value \$38,426,725; wheat, 365,200 acres, 2,081,840 bushels, value \$1,818,882; oats, 703,425 acres, 14,560,128 bushels, value \$3,787,985; ry, 4,287 acres, 24,159 bushels, value \$18,097; potatoes, 14,228 acres, 1,278,082 bushels, value \$865,244; and hay, 651,254 acres, 676,677 tons, value \$4,281,281; total value \$43,977,067. The same authority reported the cotton crop of 1894-95 at 2,550,000 bales, an amount exceeding the total product of the United States in 1870, more than half of the product of 1889, and nearly half of that of 1890.

Live Stock.—In January, 1896, the United States Department of Agriculture estimated the number and value of domestic animals on farms and ranches at the close of 1895 as follows: Horses, 1,182,777, value \$24,228,892; mules, 264,069, value \$9,125,296; milk cows, 290,698, value \$14,024,615; dairy and other cattle, 5,128,644, value \$69,520,010; sheep, 2,665,336, value \$3,820,540; and swine, 3,022,118, value \$10,088,078; total value, \$131,204,223.

Banking.—On Oct. 31, 1895, there were 224 national banks in operation and 49 in liquidation. The active ones had a combined capital of \$22,523,090; circulating notes outstanding, \$5,100,022; loans and discounts, \$45,205,967; coin and coin certificates, \$2,669,650; United States bonds, \$5,160,820, an excess of \$439,372 beyond amount required by law; deposits, \$68,979,067; and reserves, \$9,523,447, an excess of \$4,088,501 beyond requirement. During the year ending Sept. 30, 1895, the exchanges at the United States clearing houses at Galveston, Houston, Dallas, Fort Worth, and New aggregated \$443,618,234, an increase of \$71,579,498 over those of the previous year. The State banks on June 28, 1895, numbered 8, and had a combined capital of \$995,120; reserves, \$2,118,131; deposits, \$1,084,191; and surplus and profits, \$230,552.

Mineral Resources.—According to the report of the United States Geological Survey on "Mineral Resources of the United States for 1894," issued in 1895, the output of coal in Texas was 420,848 short tons, valued at \$976,458, of which 417,280 tons were loaded at the mines for shipment and the remainder sold to local trade and used by mine employees. With the exception of a slight decrease in the output

of 1891 from that of 1890, the production has shown a steady increase since 1889, when it was 128,216 tons, valued at \$340,117. During 1894 there was a production of 30,259 long tons of brown hematite iron ore, valued at \$11,571, and 4,671 long tons of pig iron. An oil, locally called petroleum, but known to differ from it, found in sinking wells for water near San Antonio, and valuable as a lubricant, had an output of 60 barrels. A rich find of cinnabar was discovered in the mountains within the Big Bend of the Rio Grande, about 100 miles from Marfa station on the Southern Pacific Railway, and was explored in August, 1894. Prof. W. P. Blake contributed a technical report on the region to the "Transactions" of the American Institute of Mining Engineers. Other productions of the year were: Sandstone, \$62,350; limestone, \$41,526; salt, 142,857 barrels, value \$101,000; cement, 8,000 barrels, value \$24,000; and gypsum, 6,925 short tons, all calcined into plaster, valued at \$27,300. The various clay products were: Common or pressed brick, \$895,359; fancy and ornamental brick, \$16,989; fire brick, \$87,360; vitrified paving brick, \$1,000; drain tile, \$10,049; sewer pipe, \$2,000; miscellaneous, \$16,096; total value, \$1,028,853. State Geologist E. T. Dumble, reporting in 1895 on the granite interests, said that during 1894 there had been shipped 150,000 tons of stone from the Granite mountain, 8 miles south of Burnet, for the jetties at Galveston, and that large quantities were being quarried for similar use at Sabine Pass and Calcasieu. Large shipments were also being made for use in the construction of public buildings within and without the State. The new courthouse at Fort Worth is being built with red granite from a quarry near Kingsland.

Pugilism.—In consequence of the announcement that a prize fight would take place in Dallas County in October, Gov. Culberson issued a proclamation, July 27, declaring prize fights to be unlawful in Texas, reciting the duties of the peace officers, and warning all parties interested in the proposed contest. He also called a special session of the Legislature, to meet on Oct. 1, and pass a bill making prize fighting a felony. Such a bill was adopted Oct. 2, by a vote of 107 yeas to 5 nays (15 absent or not voting) in the House, and by 27 yeas to 1 nay in the Senate.

Farmers' Congress.—A State Farmers' Congress was held at Fort Worth, Feb. 19 and 20, which issued an appeal to the farmers of the State to reduce the cotton acreage at least 25 per cent.; to undertake a diversification of crops; to turn their attention to raising and feeding cattle and sheep, and, as far as possible, hogs; and to encourage the establishment of factories of every description.

Cotton Convention.—A convention of cotton growers was held at Waco, March 28 and 29. Under a resolution declaring the necessity for the utmost economy in placing the cotton crop on the market, on account of low prices, a committee was appointed to confer with the Railroad Commissioners and the representatives of the principal railroads with a view to securing more favorable rates for transportation. The convention also issued an address, similar in tenor to that of the Farmers' Congress.

Irrigation.—The second annual convention of the Texas Irrigation Association was held in San Antonio, Nov. 12 to 14. Several interesting papers were presented, and resolutions were adopted providing for the organization of auxiliary associations in each county, and requesting the director of the United States Geological Survey to extend its topographical map work over those parts of western and southwestern Texas in which the results will be the most readily applicable to irrigation.

TURKEY. An empire in eastern Europe. The Sultan is an absolute ruler under the prescriptions of the Koran, and by most Sunnite Mohammedans he is revered as the Khalif of Islam. The throne is hereditary in the house of Osman, the eldest male born in the imperial harem succeeding when a vacancy occurs. The reigning Sultan is Abdul II, born Sept. 21, 1842, who came to the throne on Aug. 31, 1876, when his brother, Murad V, was deposed on the ground of insanity. The Sultan's Cabinet was composed in the beginning of 1895 as follows: Grand Vizier, Djavad Pasha, appointed in September, 1891; Sheikh-ul-Islam, Mehmed Djemal Eddin Effendi; Minister of War, Riza Pasha; Minister of the Interior, Halil Rifat Pasha; Minister of Foreign Affairs, Said Pasha; Minister of Finance, Nazif Pasha; Minister of Marine, Hassan Pasha; Minister of Public Instruction, Zuhdi Pasha; Minister of Justice and Worship, Hussein Riza Pasha; Grand Master of Artillery, Zekki Pasha; Intendant of Evkafs, Galib Pasha; Minister of Commerce and Public Works, Tefvik Pasha; without portfolio, Djedvet Pasha.

The Army.—Military service is obligatory, the term of service in the permanent army being three years for the infantry and four years for the other arms, but every conscript when he has served five months can purchase exemption for the rest of the period. Conscripts assigned to the depot reserves must serve from six to nine months. After passing through the active army men may be called upon to do military duty for two or three years in the *chtiad*, or reserves, eight years in the *redif*, or Landwehr, and six years in the *mustahfiz*, or Landsturm. The army is distributed in 7 *ordus*, or military circumscriptions, besides separate divisions in Arabia, Tripoli, and Crete. There have been organized 282 battalions of infantry, varying from 250 to 550 men, armed with Mauser rifles of 7-65 and 9-5 millimetres' caliber, fitted with magazines holding 5 cartridges; 195 squadrons of regular cavalry, each numbering from 50 to 80 troopers, besides 56 regiments of Kurdish irregulars, each numbering 600 men; and 169 batteries of field artillery, each of 6 pieces, 18 batteries of mounted artillery, and 46 mountain batteries. The actual peace strength of the army is about 180,000; the war strength, 800,000 men.

The Navy.—After having sold the strongest vessels to other Governments in the stress of financial difficulties, the Ottoman Government has begun to replace them, but has no modern armor-clad yet in a state of complete efficiency. The most powerful is the "Mesoudyeh," of 8,900 tons displacement, with 12 inches of armor and a battery of 12 18-ton guns. Four old ironclads, of 6,400 tons displacement, are being fitted with 2 11-inch Krupp guns mounted in

barbette towers. The "Hamidieh," of 6,700 tons is protected on the side with 9-inch plates and carries 10 10.2-inch Krupp guns in a central battery. The "Abdul Kader" is a cruiser of 8,000 tons, protected with 14-inch armor and armed with 4 11-inch Krupp guns mounted *en barbette*. There are a dozen old ironclads fit for port defense. Two deck-protected cruisers, of 4,000 tons, have lately been constructed, and 3 smaller ones are building. A torpedo destroyer, launched in 1892, has a speed of 23 knots. Of torpedo boats, 9 of the first, 15 of the second, and 7 of the third class have been acquired.

The Armenian Question.—The dragomans of the British, French, and Russian consulates at Erzerum were selected to act as European commissioners at the inquiry into the killing of Armenians in Sasun, Kurdistan, in August and September, 1894, and the joint commission began its investigation at Mush in January, 1895. At the suggestion of European governments the Governor of Bitlis, Tahsin Pasha, was removed soon after examination of witnesses began.

The Armenians who occupy the fertile valleys in Sasun are accustomed to pay heavy tribute to neighboring Kurdish chiefs, who in return engage to protect them against Kurdish marauders. For some years the villages of the Dalvorig district had refused to pay the Government taxes, on the ground that they could not afford to give more than the Kurds exacted of them. The Governor of Bitlis, learning that Armenian agitators were at work among the peasants, ordered Kurdish irregulars to keep guard over the refractory villages. At the end of May, 1893, Daghamatian, one of the revolutionary agitators, was caught and sent to Constantinople. A few days afterward the Armenians attacked Kurds encamped in the neighborhood, and drove them off. The Turkish governor then placed a guard of troops and Kurds in the disturbed district. The Kurds and the Armenians had been on bad terms for eight years. The Kurds accused the Christians of robbing villages, kidnapping women, and desecrating mosques. The troops quartered on the Armenians of Dalvorig trampled their crops, and in retaliation the Armenians robbed caravans of wheat and plundered the flocks of Kurds. They were ready to fight the Kurds, having now some breechloaders and a gunsmith, sent by the revolutionary party from Russia, had made out of their old flintlocks. The revolutionary funds were provided by the Armenian merchants of Russia and Persia. Daghamatian and Dr. Hampartsum Boghian, who was afterward arrested and sentenced to death in December, 1894, under the name of Murad Effendi, are supposed to have come from Russia to head a revolutionary uprising that they planned to start in 1895 simultaneously in Zeitun, Sasun, and on the Russian and Persian frontiers. The Armenians of Sasun were expected to make an attack on Mush and attempt to surprise the garrison and seize their arms and ammunition. The leaders counted on the intervention of the European powers rather than upon the ability of the Armenians to cope with the Turkish forces. Dr. Hampartsum said at his trial that he went to Dalvorig to teach the Armenians not to sell their daughters in marriage and to stand up for their rights against

the Kurds. After the Dalvorig district of Sasun became a new revolutionary center, Tahsin Pasha, under instructions from Constantinople, placed a garrison of troops in the district, and after the outbreak of 1893 it was practically kept in a state of siege. The Kurdish tribes understood that they might harm and rob the fractious villagers at their will. When a Kurdish tribe seized some cattle in August, 1894, the Kurdish chief who was the protector of the village helped the Armenians to drive off the marauders. Some rushed official telegraphed to Constantinople that the threatened revolution had broken out in Sasun, and the order came back to punish the villagers to the last extremity. Zeli Pasha sent Turkish regulars to surround the disturbed district, while the Kurdish irregulars were sent forward with instructions to kill and destroy without mercy. The Kurds, who were under contract to protect the villages, joined the others when the signal for rapine went forth, and all embraced the opportunity for pillage, but had little heart for the slaughter that the Turkish officers thought would be pleasing to the authorities at Constantinople. Therefore Turkish soldiers, assuming the Kurdish dress, went in to encourage and lead in the work of carnage. The Armenians defended themselves as well as they could in their villages, till their ammunition was nearly exhausted, and then concentrated in the center of Mt. Andok, where they were eventually put to the sword, or fled into the forests or mountains, where they were hunted and cut down. The survivors tell stories of cruelty, rape, and butchery that seem incredible—as how Turkish soldiers eagerly slew pregnant women, because they could thus with one stroke add two to their tale of victims. They relate many tales of Armenian heroism, too, how Shaker, a young widow, led a band of maidens in a leap from a cliff to escape Turkish harms, and how men and women refused, without exception, to save themselves from torture and death by embracing Islamism. When armed troops with cannon entered the district the Armenians did not attempt to resist them until they were surrounded in their mountain fastness. More than 40 villages were destroyed. The number of individuals slain is supposed to have been between 3,000 and 5,000. Zeli Pasha reported 1,730 Armenians killed. Abdul Hamid regretted keenly his precipitate order, and is said to have reproved his first secretary, Suresh Pasha, for his haste in forwarding it with such harshness that the agitated official, who suffered from a heart affection, fell dead on the spot.

When the European commissioners first arrived in Mush no Armenian was allowed to communicate with them. Attempts were made to inveigle the Mush Armenians into signing a statement that the reports of the Sasun massacre were pure inventions. The prisoners in Bitlis were offered their freedom if they would sign papers incriminating the imprisoned Armenian notables, and Mr. Howard, the British vice-consul at Van, who first reported the massacre. After the removal of Tahsin Pasha, Avetis Gagegoun and two other members of the Armenian Mejlis were released after having been imprisoned seventy-two days without charges.

and 11 who remained in confinement were set free later, but 11 notables had died in prison. The foreign commissioners were now able to discover and indicate to the Turkish commission Armenian witnesses who could throw light on the Sasun horrors. Sentences of death that had been passed by a court-martial at Erzinjan upon 21 Armenians and sentences of imprisonment for life or long terms passed upon 37 others were confirmed in January by the Court of Cassation in Constantinople.

The Armenian National Assembly elected Monsignor Izmirlian, an outspoken champion of Armenian liberties, to be the Patriarch at Constantinople. The Porte at first refused to confirm him unless he would engage to conform his conduct to the wishes of the Government. He steadily refused, and in the end was accepted without pledges, and was enthroned on Jan. 9, 1895. In his address he said that fidelity to the Government should be based upon the conviction that the Armenians would enjoy absolute security for their honor, their lives, and their property. All the Armenian bishops were in prison or exile. The Archbishop of Marash had been sentenced for harboring rebels; the Archbishop of Zeitun was convicted on charges of fortifying a monastery, delivering prisoners from jail, and presiding over a revolutionary committee; the Bishop of Mush was accused of inciting the Armenian population to sedition; and the Bishops of Hadjin, Kemakh, Bulanck, and Adana and the Abbots of Fernuz and Surp-Arakelotz were restrained of their liberty on similar charges. The Bishop of Arabgir, reputed to be an active revolutionary worker, was first removed to Diarbekir, and when he again incited the people he was exiled to Jerusalem. The new patriarch reprimanded the Bishop of Adrianople for signing, at the solicitation of the Ottoman authorities, an address to the Sultan reproaching the disloyalty of the Armenians of Asia. Besides the prelates, 55 priests and deacons and many other leading members of the community were undergoing imprisonment or exile. From the beginning of 1895 the arrests in Constantinople and in Asia became more frequent. It was estimated that nearly 3,000 Armenians were political prisoners in the various provinces.

The investigation of the Sasun affair and the menace of European coercion to secure the execution of Article LXI of the Berlin Treaty caused the Ottoman authorities to relax the severity of some of their repressive measures, though the increased activity of the Armenian agitators compelled the police to be more vigilant than ever. The Huntchagists seized the opportunity to promote their revolutionary schemes by unscrupulous methods. Some of them were supposed to have laid a plot to murder Dr. Edward Riggs and two other American missionaries at Marsovan who had devoted their lives to the education of Armenian youth, merely in order to fasten the blame upon the Turks and provoke the intervention of the United States Government. The revolutionists are reported to have committed inhuman outrages, such as puncturing the flesh of men and women and igniting gunpowder in the wound, that the infuriated Turks might shock the Christian world by the atrocity of their retaliation.

A commission appointed by the Sultan to consider a scheme for administrative reforms in Armenia began its sittings on April 23, in Constantinople, under the presidency of Turkhan Pasha, Governor of Crete. A project of Armenian reforms drawn up by the ambassadors of France, Great Britain, and Russia, was presented to the Sultan on May 11. It was recommended that the names of valis to be appointed should be submitted for the approval of the powers; that the boundaries of the vilayets and their subdivisions be altered so as to make the administrative districts as homogeneous in population as possible; that a gendarmerie be recruited from the Mohammedan and Christian population alike; criminal courts constituted; prison inspection introduced; the collection of taxes intrusted to local officials, and a share retained for local administration; that the farming of titles and the *corvée* be abolished; and that the Kurdish Hamadieli cavalry should not wear uniforms or carry arms except when exercising or serving with the regular Turkish troops. The reforms were to be carried out under the direction of a high commissioner appointed with the approval of the powers and under the supervision of a permanent Committee of Control sitting at the Sublime Porte, to consist of 3 Mohammedans and 3 Christians. One third of the administrative, judicial, police, and other offices should be Christians. The Christian mutessarifs, kaimakams, and mudirs should be placed over the sanjaks, cazas, and communal circles in which the Christians are most numerous, and should have Mohammedan assistants, while in vilayets, sanjaks, cazas, and nahies in which the governor or mutessarif or kaimakam or mayor is a Mussulman he would have a Christian assistant. As a preliminary to the reforms, the Sultan was expected to amnesty all Armenians convicted of purely political offenses, restore exiles to their homes and property, and indemnify the victims of Sasun.

The Porte replied to the memorandum of the ambassadors on June 3, objecting to the proposed interference of the powers in the appointment of a high commissioner and to the minute and specific form of the reforms demanded, many of which were pronounced impracticable. On June 16, after a new Cabinet had been appointed, a fresh reply was given in which the Ottoman Government accepted the reforms in principle, but requested a discussion of the details, and denied that the Berlin Treaty confers upon the powers the right to demand the guarantees formulated in the scheme.

Djevad Pasha, the Grand Vizier, was dismissed on June 8, and Said Pasha, ex-Grand Vizier, was appointed in his stead. Turkhan Pasha became Minister of Foreign Affairs in Said's place; the other ministers remained. A committee of ministers, composed of Turkhan Pasha, Halil Rifat Pasha, Riza Pasha, Zuhdi Pasha, and Tevfik Pasha, was appointed to devise a scheme of Armenian reforms in connection with the project of the powers. Shakir Pasha was appointed to superintend the application of the reforms that should finally be adopted. On Aug. 1 the Porte made a detailed reply to the powers, proposing to appoint Christian assessors to assist the valis, to inspect and

improve the prisons, to recruit gendarmerie and police from Mohammedans and Christians in proportion to their numbers, and to prevent the Kurds from committing excesses or encroachments. This reply was declared by the ambassadors to be unsatisfactory. On Sept. 7 the Porte offered, as further concessions, to grant to the dragomans of the embassies the privilege of communicating directly with the Turkish Committee of Control, to admit Christian officers to the gendarmerie, to establish a rural constabulary, to allow the mudirs to be elected by the councils of elders, and, while no Christian vali or mutemarif should be appointed, to select the other administrative officers from Mohammedans or Christians in proportion to the population. This did not go far enough to satisfy the British Government, which now began to threaten coercion, but the Russian Government was unwilling to proceed to extreme measures. The Porte complained at Paris and St. Petersburg of the discourteous attitude of Great Britain, declaring that it was derogatory to the Sultan's prestige, but the replies made to this protest gave no encouragement to Turkey. Lord Salisbury went beyond the first demand for a European control over the application of the reforms, suggesting that the three powers should be represented on the permanent Committee of Control, and that the high commissioner charged with the execution of the reforms should be a Christian selected by the powers. The Russian Government declined to support this supplementary demand, and France took the same view as Russia. A British squadron, which had gone to Salonica, was moved on Sept. 28 to Lemnos, at the entrance of the Dardanelles. The attitude of the British Government encouraged the Armenian revolutionists throughout Turkey. Their desperate designs had been shown hitherto chiefly by assassination and terrorism practiced upon their compatriots, who opposed or betrayed them. Garabed, the head of the Protestant community in Marsovan, was murdered on July 1, and the American missionaries were threatened. The American mission school at Tarsus was attacked early in August by a mob of Mussulmans, who maltreated some of the students and threatened the professors. In Constantinople several Armenians suspected of being police spies were murdered at different times. A band of Armenian brigands robbed a Turkish officer near Erzlinghian. Kurds who plundered Armenian villagers in the Mush district were driven off by the Turkish gendarmerie. In eastern Armenia, especially in Bitlis, Erzerum, and about Lake Van, thousands of rifles were hidden away by the revolutionists. In Constantinople the Armenians prepared for an extensive demonstration, and when the patriarch was asked by the Porte to forbid it, he declared he was powerless to restrain his countrymen. Nearly 3,000 assembled at the cathedral on Sept. 30, and, in spite of the warning of the patriarch, who told them that they were breaking the laws, attempted to march in procession to the Sublime Porte to present a petition. The police broke up the procession and arrested many, but they gathered at another point. There Servet Bey, at the head of a body of gendarmes, commanded them to disperse and leave

their petition with him. They pressed forward nevertheless, and some fired pistols, killing Servet Bey and another officer. In the evening, after the police had driven back the rioters, and again in the following evening, Sofias marched through the streets with flags, attacking Armenians, of whom 172 were killed by police and Sofias. The Armenians took refuge in the churches, which they would not leave by day or night. Many who were arrested carried revolvers and knives of uniform pattern, showing that the affair was organized by the revolutionary society, while the clubs carried by the Sofias were also of one form, indicating that they too were armed beforehand. Hundreds of Armenians were arrested.

Immediately after the Istanbul riots the Sultan dismissed Faid Pasha, and made Kiamil Pasha Grand Vizier on Oct. 2. Faid Pasha became Minister of Foreign Affairs. The persistence of the Armenians of Istanbul in remaining in their churches prolonged the excitement and spread alarm in the provinces. The police, therefore, on Oct. 9, drove them out and closed the churches. Sir Philip Currie, the British ambassador, urged on the new Grand Vizier the necessity of promptly accepting the whole scheme of reform. Austria-Hungary, Germany, and Italy joined the other three signatory powers in an identical note demanding provisions for public safety.

The Moslem population in Asia Minor was stirred to fury by stories of the Constantinople riots. Turks, Circassians, Kurds, and Lazes, whether living in the country districts or in towns, hate the Armenians, because they are the successful merchants and farmers of the country, almost the only possessors of wealth and education. When a mob in Trabzon murdered and pillaged the Armenians without restraint on Oct. 8, the imperial artillery joining in the work, the Moslems of other places easily worked themselves up to the point of attacking the Armenians, whose lands, goods, and money were a tempting booty. In Trabzon the mob began to sack the shops of the Armenians, and when the latter resisted a general massacre followed. The Turkish officials reacted, and Armenian revolutionists started the riots by firing upon a party of imperial officers. Though the better class of Turks slinked and sheltered the victims, 800 were killed. Villages in the vicinity were burned and pillaged also. On Oct. 9 Moslem villagers killed 45 Armenians at Ak Hissar. On Oct. 11 a massacre occurred at Gornushane, and on Oct. 19 one at Balikot, in which 1,000 lives were taken by Lazes and Turks; at Afshian 200 persons were killed. On Oct. 21 at Erzlinghian and in the neighborhood 1,000 persons were slaughtered on Oct. 22. In outbreaks that occurred on Oct. 25 there were 2,500 killed at Diarbekir, 900 at Suleis, and 400 at Palo, Kurds and Turks combining to murder and pillage, and many regular soldiers taking part. On the same day Circassians and Turks killed 200 Armenians at Kara Hissar.

The Sultan sanctioned the reforms demanded in the note of May 11, and issued an order to that effect on Oct. 20, but this did not cause the cessation of the massacres, which in the rural districts seemed to have the utter extermination

and in the towns the complete spoliation of the Armenians for their object. A revolutionary party that sprang up among the Turks added to the anarchy and terror. Threats were uttered against the Sultan and against Hassan Pasha, Minister of Marine, who was the chief representative of the Old Turkish party. In the provinces where the Armenians were most numerous, and where they were provided with arms smuggled in from Persia and Russia, they did something to provoke the attacks. At least the Turks accused them of killing a Moslem priest at Erzinghian, of assaulting worshippers in the mosques of Bitlis, and of beginning the disturbance at Baiburt by firing upon the Mussulmans. At Marash and Zeitun also they were said to have attempted a revolu-

tion of the metropolis was thrown into confusion, and dishonored notes and drafts accumulated in such numbers at the end of two weeks that on Nov. 2 the Porte, in order to prevent a financial crash, proclaimed a moratorium for four months. To precipitate a panic Armenians had organized a run on the Imperial Ottoman Bank, but that bank and some other strong institutions refused to take advantage of the moratorium.

A commission was appointed for the execution of the reforms in Armenia, of which Shefik Effendi was made president. The six powers renewed their demand for the restoration of order throughout the empire. After the Trebizond massacre the reserves were called out, and now the members of the Redif were summoned

TREBIZOND, SCENE OF AN ARMENIAN MASSACRE.

tion. They were accused of attacking the palace of the Vali, and were certainly prepared to fight in Erzerum, where riots occurred on Oct. 30, in which 800 Armenians lost their lives. There most of the plundering and shooting was done by mutinous Turkish soldiers, though Shakir Pasha and Raouf Pasha, the Vali, and his officers did all that they could to preserve order. The authorities of Diarbekir reported that they had almost succeeded in suppressing the disturbance, and driving out the Kurds who began the massacre, when the Armenians assumed the offensive, throwing bombs and firing at muezzins who were calling the Mohammedans to prayers. The Armenians were all armed, and in the fight they killed 1,500 Mussulmans.

The Armenian revolutionists in Constantinople compelled all the merchants and shopkeepers of their nationality to close their places of business. Whoever attempted any dealings was stopped and made to pay a heavy fine into the revolutionary fund. All the commercial busi-

ness also. In the remote districts the massacres continued, and in some places Greeks and Maronites were attacked as well as Armenians. The excitement extended into all parts of Anatolia and into Syria and Mesopotamia. The belief gained ground among Moslems that the Sultan had sanctioned the extermination of the Armenians, when Kiamil Pasha, who had been appointed Grand Vizier in deference to the powers, was summarily dismissed on Nov. 6, and sent away to Aleppo, and Halil Rifa Pasha was appointed to succeed him. Teflik Pasha was made Minister of Foreign Affairs; Said Pasha, President of the Council; Abdurrahman Pasha, Minister of Justice; Meimduh Pasha, Minister of the Interior; Gareid Pasha, Minister of Worship; Zuhdi Pasha, Minister of Education; Mehmed Djelal Eddin Raba, Minister of Commerce and Works; Sabri Bey, Minister of Finance; and Aarifi Pasha, a minister without a portfolio. This was regarded as a reactionary Cabinet, formed to please the part of the Mohammedan

population that was opposed to reforms. The Government was so helpless and disorganized that the ministers no longer possessed authority or control. The Sultan distrusted his official advisers and was guided only by the advice of officials of the palace, who played upon his fears and intrigued one against another. Revolution was rife among the Moslems as well as among the Armenians. Spies and informers were everywhere. Citizens suddenly disappeared, and officials were arrested or disgraced without a warning. One officer of the palace presented a memorial to the Sultan pointing out the evils and dangers of his capricious autocracy, but he was dismissed and tried by court-martial as a traitor. Many Softas and religious men were filled with the spirit of revolution, and these were the most dangerous enemies of the men in power, for they plotted the deposition of the Sultan and the cleansing of the public service. The Young Turkey party was not ready for revolution, because it was not agreed on principles and aims. Faithful Mohammedans wanted a new Sultan and a thorough purification of the Government in accordance with the religious laws, and hoped thereby to deliver Turkey from the military, political, and financial domination of Europe. But an equally strong element appealed to Moslems and Christians to join together to limit the autocracy of the Sultan and the powers of provincial administrators and advance toward a representative system of government. Seditious placards threatening the deposition of the Sultan were posted in the capital, and revolutionary circulars were distributed in the streets and houses and even in the Yildiz Kiosk. The police had begun, after the riot of Sept. 30, to deport suspected Armenians to the provinces. After revolutionary ideas manifested themselves among Mohammedans, Softas and others were arrested and sent away without publicity, and many were believed to have been secretly executed.

In the customary speech at Guildhall on Nov. 9 the English Minister of Foreign Affairs, Lord Salisbury, declared that the accord of the powers was complete, and warned the Sultan that he could not look for dissensions to give him an excuse for evading the execution of the promised reforms, but would invite the inevitable doom of persistent misgovernment. Abdul Hamid was so pained at this expression of mistrust that he wrote to the English Premier, saying: "I will execute the reforms. I will keep the document before my eyes to see that every article is put in force. This is my earnest determination, and I give my word of honor."

In the district of Zeitun the Armenians rose in open revolt against the Government. They captured the strong position of Chikur Hissar, compelling a battalion of regular troops to surrender, but were afterward expelled. The Kurds and Turks fell upon the defenseless Armenian communities of the neighboring regions with more relentless fury. On Nov. 6 they killed 2,000 at Arabkir; 250 were slain in Malatia, and massacres occurred at Tokat, Amasia, Genezek, Egin, Zileh, and Selert. On Nov. 10 they butchered 3,000 at Gurun. Soldiers joined in the sacking of the Armenian quarter in Harput on Nov. 11, when 1,000 were killed, also in the

massacre of 1,200 Armenians at Givas on Nov. 12. On Nov. 15 the Kurds invaded Van, which was saved by the courageous firmness of the Mutassarrif, who threw himself in front of their rifles. On the same day the Turks started a riot at Marash, where 120 Armenians were killed. In Harput the houses of Armenian missionaries were looted and buildings burned, and in Marash the schools of the American mission were destroyed. Before the end of the month the Turkish troops had resumed order, as the Armenians had been wiped out in most of the places peopled by them in Armenia and Kurdistan. On Nov. 26 the Circassians and Turks killed 1,000 Armenians at Kahirich. As many as 2,500 Armenian villages are supposed to have been destroyed and a majority of the male population killed, while in the towns the victims were estimated at 20,000. A great number of women and some of the men underwent Mohammedan treatment to escape death. These were believed to be 275,000, half of the agricultural population, left starving, half naked, and shelterless, and of these two thirds were women and children. In the towns 75,000 were left destitute. The authorities accused the Armenian revolutionists of beginning the disturbance in Swaz, Arakair, and other places, and reported that a large number of explosive bombs were found in their houses. No revolutionary attempt was made, however, until the Kurds had raided the country districts, driving off the sheep and cattle, and were beginning to pillage the towns. From the beginning of October Mohammedans in all the six provinces of Armenia threatened a general massacre of the Armenians, who seek pitiable passage imploring protection to the governors, to the Pasha, to the patriarch, and to the foreign embassies. Syrians and other Christians, besides the Gregorian Armenians, were not threatened and were seldom molested, and in every district Mohammedans of the better class endeavored to save the Armenians from destruction. After the ravage had been stopped, the Government fed the survivors in the cities with bread; in the desolated farming districts they lived in caves and temporary huts, with nothing but roots and leaves to stay their hunger. Although order was restored in the villages of the Armenian provinces, except for occasional lawless acts of desperate Armenians, the Kurds of the southern mountains were not subdued nor checked in their depredations. In Van, Bitlis, and Aleppo the domination of Armenian villages continued till the end of the year. A massacre was reported from Oshak, where Kurdish Hamashiks and Bedouins were said to have slaughtered 3,000 Armenian and Chaldean Christians on Dec. 29 and 30.

The powers could not agree upon any form of active intervention to stop the massacres. The Russian Government was convinced by the reports of its consular officers that the Armenians by their revolutionary conspiracy and attempted uprisings had provoked the vengeance of the Mohammedans. The six powers assembled an enormous fleet of war ships in the waters of the Levant, as if to escape Turkey, but their concerted action was restricted to such mild permission to have a second vessel at Constantinople, which for three weeks the Sultan refused.

but finally granted on Dec. 10. During this time the situation was complicated by the flight of Said Pasha, who, after declining to accept the Grand Vizierate again, took refuge at the British embassy, and would not obey the summons of the Sultan, as though he feared death or imprisonment. For five days he persisted in his determination to leave the country, but was persuaded on Dec. 9 to return to his residence, having received assurances of his safety from the Sultan.

The Armenian insurgents of Zeitun plundered and burned the villages of Beehan, Gukasdurtet, Ghudji, Oqueatur, Kerim, Demerel, Sariken-churk, Chukur Hissar, and Keban, and the town of Denderine. They killed 266 Mohammedans. On Nov. 13 a force of Armenians, commanded by a Russian Armenian, captured the fort held by Turkish troops at Zeitun, using dynamite in the attack with great effect. The Turkish military authorities ordered 20,000 troops to advance upon Zeitun from the nearest posts. Amnesty and protection were offered to the rebels if they would surrender their arms and their leaders. The people of Zeitun, who are the most warlike of the Armenians, brigands by profession, had always maintained their independence until the Turkish fort was built in 1878. Notables were sent from Aleppo to persuade the rebels to surrender. The Turks threatened to bombard and destroy the town. On Dec. 24 the besieging forces advanced, and, when the insurgents had answered with defiance a final summons to surrender, attacked the place, but were worsted and compelled to retreat. The combatants, however, subsequently evacuated the town after the women and children had escaped to the mountains. They removed their guns to a higher point that dominated the Turkish position and protected the villages of the valley. The ambassadors intervened to save the Zeitunis from the destruction that was threatened when the Turks overcame their resistance. By arrangement with the Porte European consular officers were sent to Zeitun to negotiate terms of capitulation.

Revolt of the Druses.—On Dec. 1 a Turkish force of 1,500 men encountered a body of Druses of Mejd-el-esh-Shams who were carrying on war with the Circassians settled in their vicinity and with a neighboring Arab tribe. The Arabs had

lured the Druses into an ambuscade set for them by the Circassians, and they were already losing, when the Turkish troops arrived and put them to flight. The Circassians burned 20 of their villages, killing women and children. The Druses lost 150 killed. Their brothers of the Lebanon set out to go to their aid, but were stopped by Turkish troops that were sent in force into the district to put a stop to the fighting, and also to compel the Druses to accept military service and to pay the taxes that were in arrears for sixteen years. There was a severe encounter on Dec. 21, in which the Turkish artillery and infantry swept away the Druses by hundreds.

Outrage at Jiddah.—On May 30 William S. Richards, British consul; Abdur Razzak, British vice-consul and consul for Sweden and Norway; C. Brandt, Russian consul; and E. Dorville, French consular secretary, were attacked outside of Jiddah, the port of Mecca, by 8 Bedouins, who killed the British vice-consul and dangerously wounded the others. The ambassadors demanded an indemnity and the punishment of the guilty parties, and the English, French, and Russian governments sent war ships to Jiddah. The Shereef of Mecca and the Vali of the Hedjaz held an inquiry. The Bedouins were angered by the quarantine measures adopted for the Mecca pilgrimage, especially the fencing and guarding of the wells reserved for pilgrims. They destroyed the cholera hospital at Jiddah and expressed general satisfaction at the murderous attack on the consular representatives. The ambassadors demanded that the Bedouins be disarmed, but the Porte knew of no way to do that.

Revolt in Muscat.—Insurgent Bedouins under Shaik Syed Sule captured in February the town of Muscat and the palace of the Sultan, who fled to the forts and opened fire upon the town, demolishing many buildings. The Sultan's forces invested the town, but could not recapture it, for the rebels, though numbering only 350 men, were armed with Martini-Henry rifles, while the Sultan's troops, numbering 2,500, had obsolete weapons. The Sultan finally offered a ransom of \$16,000, and the rebels evacuated the place in the middle of March, after first sacking the palace and the shops.

U

UNITARIANS. The "Yearbook of the Unitarian Congregational Churches" for 1896 gives lists of 519 ministers and 455 societies of this denomination in the United States. The number of members is given in the tables of the "Independent" as 68,500. The churches are represented in general bodies by the National Conference of Unitarian and other Christian Churches, which meets every three years; the American Unitarian Association, whose purpose is to promote union, sympathy, and co-operation among liberal Christians, collect and diffuse information, supply missionaries and books, and aid in sustenance of ministers and in Church extension; the church building loan fund; 9 district conferences; 9 State conferences and

associations; local conferences; the National Alliance of Unitarian and other Christian Women, and its local branches; the Unitarian Sunday-school Society and local societies of similar character; and 3 ministerial associations. Unitarian theology is represented in the Divinity School of Harvard University, and the Meadville Theological Seminary, Meadville, Pa., is a Unitarian institution. Four academies are named in the "Yearbook," and numerous Unitarian clubs and special societies.

The British Unitarians have 279 churches in England, 33 in Wales, 8 in Scotland, and 36 in Ireland. They are represented in the British and Foreign Unitarian Association and the National Conference, which meets every three years.

The 60,000 Unitarians in Hungary have more than 100 churches with settled pastors, and 50 or more filial churches, with a bishop, Joseph Ferencz, 8 rural deans, and an ecclesiastical council of 350 members.

Unitarian or Liberal Christian principles are represented in the Protestanten Verein of Germany, the Protestanten Bond of Holland, by a minority of Protestants in France, in the liberal congregations of the Spanish Evangelical Church, by a number of societies and by liberal Christians in the State Church of Sweden, in the Free Christian Association of Switzerland, and at several places in India and in Japan, where considerable missionary work has been done.

The sixteenth triennial Conference of Unitarian and other Christian Churches met in Washington, D. C., Oct. 23. In the absence of the president, Hon. G. F. Hoar, Mr. Dorman B. Eaton, of New York, presided. The following version of the resolutions on Christian unity was adopted:

Resolved, That this Church accepts the religion of Jesus, holding, in accordance with his teaching, that practical religion is summed up in love to God and love to man; and we cordially invite to our working fellowship any who, while differing from us in belief, are in general sympathy with our spirit and our practice.

Resolved, That the National Council give the above declaration the widest possible publicity, as a sufficient basis not only for "Christian unity," but also for the religious unity of the world.

A feature of the proceedings was the presentation of the Unitarian position on certain religious and theological questions from the various points of view of the several speakers. The Rev. George Bachelder, having presented in the opening address a survey of the history of the organization, said that Unitarians are not agnostics, but believe in the doctrine that righteousness is salvation, and that all the law is summed up in love to God and love to man. The Rev. Dr. Furness, of Philadelphia, declared that miracles are but violations of natural laws, out of harmony with all known or probable truths, and believed in by no one of education. The Rev. Charles C. Deane, of Harvard Theological School, affirmed that Unitarians who accept part or all of the New Testament stories of the miraculous see in them manifestations of higher laws instead of a breaking through of all laws. Unitarians like to speak of God as the Father revealing himself in the order of beauty of the universe, and believe that in the future life there will open to every soul the highest possibilities for which it is fitted. The Rev. Mary A. Safford interpreted the "doctrine of forgiveness" as not setting aside the law of consequences, but as making us feel that in spite of sin God loves us still. The Rev. William C. Gannett held that God had appeared to man in many lands and many forms, of which the Christian incarnation marked the culmination. Resolutions were adopted declaring the need of the purification of politics, condemning the liquor traffic, and expressing sympathy with the Armenians and invoking the intervention of the powers to secure better Government in Turkey.

The meeting of the British and Foreign Unitarian Association, held in London in May, was

attended by 2 delegates from the United States. The Rev. S. J. Barrows, of Boston, mentioned the curious fact that the American and the English Associations were both founded on the same day of the same year, and spoke of the great number of conspicuous names in literature, science, and Government that have rendered illustrious the seventy years of American Unitarianism. A fraternal resolution was adopted with reference to the Hungarian Unitarians, with whom this association keeps up a friendly intercourse. It is so arranged that a student from Hungary is constantly found in the classes of the Unitarian College at Manchester, and several of the alumni of that institution are engaged in Hungarian parishes. The institution is contemplated of similar scholarships for Unitarian students from India and Japan. At the home-mission meeting reports were received from the Manchester district, from Wales, and from the Northumberland district. The subject of "The Social Implications of our Faith" was discussed at one of the conferences. A meeting was held in behalf of the Sunday-school Association.

UNITED BRETHRENS CHURCH.—"The United Brethren Yearbook" for 1896 gives statistics of this Church, of which the following is a summary: Number of organized churches, 4,242; of bishops, 5; of itinerant preachers, 1,669; of local preachers, 493; of members, 225,204; of Young People's Christian Union Societies, 1,418, with 56,466 members; of Sunday schools, 3,573, with 23,100 officers and teachers and 246,356 pupils. Amount of contributions: For preachers' salaries, \$589,214; for Church expenses, \$284,359; for support of bishops, \$1,376; for preachers' aid, \$4,207; for general missions, \$46,051; for thank offerings and special contributions, \$9,202; for women's missions, \$15,162; total for missions, \$49,316; for Church erection, \$6,231; for Sunday-school general fund and Children's Day, \$2,808; for beneficiary education, \$1,594; for colleges, etc., \$18,401; total Sunday-school collections, \$7,593; number of Church houses, 3,222, valued at \$1,187,409; number of parsonages, 612, valued at \$341,566.

The Board of Education had during the year ending April 30, 1895, 49 beneficiaries to whom aid had been given to the amount of \$1,822, an average of about \$71 to each. The year's receipts of the Educational Beneficiary fund were \$2,864, about half of which was from the repayment of loans by beneficiaries.

The Board of Church Extension received \$4,596, of which \$2,589 were from loans returned and \$2,007 from collections by missionaries. The amount loaned to churches was \$1,800. Numerous urgent applications had been received which the board would not grant for want of funds.

The forty-second annual meeting of the Home, Frontier, and Foreign Missionary Society was held at Fort Wayne, Ind., May 15. The total receipts for the year had been \$95,113, and the expenditures were \$874 in excess of this amount. In its foreign work the society had 39 churches with 663 members in Germany and 200 preaching places with 3,638 members in Africa. The addition of a medical department in the Echo-Clark and Wife Training School in Africa and the establishment of a sanatorium at Sierra Leone

cester, near Freetown, were recommended. The opening of a mission in Japan was decided upon, to which 4 native Japanese educated in the United States have been appointed. The corresponding secretary of the board has been deputed to Japan to superintend the beginning of the mission. The most important feature of the year's work in the home-mission field was the extension of the Church in Tennessee and other parts of the Southern States, where a mission conference had existed in East Tennessee for several years. Two new presiding elders' districts had been formed, more than 20 ministers received, and more than 1,000 members gathered in. Appropriations of \$37,147 were made for the missionary work of the ensuing year.

UNITED STATES OF AMERICA, a federal republic of 45 States in North America. The executive power is vested in a President elected for four years by electors equal in each State to the number of its Senators and Representatives in Congress. Candidates for President are nominated in party conventions, and each party presents to the voters a list of electors who will vote for its candidate. The legislative power is vested in the Congress, consisting of a Senate, in which each State is represented by 2 members, elected for six years by the State Legislature, and a House of Representatives, consisting of 356 members, elected for two years by direct vote of the qualified electors of each State, 1 from each Congressional district, and 4 Territorial delegates. The reapportionment based on the census of 1890 gives one Representative to every 173,900 inhabitants. The Vice-President, who on the death or retirement of the President becomes President for the remainder of the term, is *ex officio* the presiding officer of the Senate. The President for the term ending March 4, 1897, is Grover Cleveland, of New York, born March 18, 1837. The Vice-President is Adlai Ewing Stevenson, of Illinois.

The President's Cabinet at the beginning of 1895 was composed as follows: Secretary of State, Walter Q. Gresham, of Indiana; Secretary of the Treasury, John G. Carlisle, of Kentucky; Secretary of War, Daniel S. Lamont, of New York; Secretary of the Interior, Hoke Smith, of Georgia; Secretary of the Navy, Hilary A. Herbert, of Alabama; Postmaster-General, Wilson S. Bissell, of New York; Attorney-General, Richard Olney, of Massachusetts; Secretary of Agriculture, Julius S. Morton, of Nebraska. After the death of Secretary Gresham (May 28) President Cleveland appointed Richard Olney, of Massachusetts, Secretary of State, and called Judson Harmon, of Ohio, into the Cabinet to take Mr. Olney's place as Attorney-General. On the retirement of Mr. Bissell, William L. Wilson, of West Virginia, was appointed to succeed him as Postmaster-General.

Judson Harmon was born in Ohio in 1846. He was educated in the Cincinnati schools and in Denison University, at Granville, Ohio, and studied jurisprudence in the Law School at Cincinnati, where he was graduated in 1869. He joined the Democratic party in 1872 with the Republican seceders who supported Horace Greeley for the presidency. In 1876 he was a candidate for the office of judge of the Court of Common Pleas in Cincinnati and he was declared elected, but the Legislature seated him in favor of Judge Can, ex-Secretary of the Interior. A few years

later he was elected judge of the Superior Court, but he soon resigned from the bench in order to resume practice, becoming a member of the firm of Culster, Goldsmith & Hoadly. His services as an advocate were much sought after, and in the profession he has

JUDSON HARMON, ATTORNEY GENERAL.

been esteemed a sound, sagacious lawyer. He was nominated and confirmed as Attorney-General to succeed Mr. Olney, who was advanced to the State Department on the death of Secretary Gresham.

William Lyne Wilson was born in Jefferson County, Va., May 3, 1843. He was educated at Columbian

WILLIAM L. WILSON, POSTMASTER-GENERAL.

College and at the University of Virginia; served in the Confederate army, and after the war was Professor of Latin in Columbian College for six years.

He studied law at the same time, and when he was admitted to the bar, in 1871, he engaged in practice at Charlestown, W. Va. He was a delegate to the Democratic National Convention in 1880, and was a presidential elector in that year. In 1882 he became President of the University of West Virginia, on being elected as a Democrat to the House of Representatives he resigned that office and took his seat Dec. 1, 1888. As a member of the Ways and Means Committee in 1888 he had much to do with framing the Mills tariff bill, passed in that session, and as chairman of the same committee in 1890 he was the principal author of the tariff bill known popularly by his name. He was nominated and confirmed as Postmaster-General to succeed Hon. Wilson S. Russell, resigned.

The Judiciary.—The Supreme Court of the United States in the beginning of 1895 was composed of Melville W. Fuller, of Illinois, Chief Justice, and the following Associate Justices: Horace Gray, of Massachusetts; Henry D. Brown, of Michigan; George Shiras, Jr., of Pennsylvania; Howell E. Jackson, of Tennessee; Edward D. White, of Louisiana; John M. Harlan, of Kentucky; David J. Brewer, of Kansas; and Stephen J. Field, of California. After the death, on Aug. 8, 1895, of Justice Jackson, the President nominated for the vacancy Rufus W. Peckham, of New York, who was duly confirmed by the Senate.

Rufus Wheeler Peckham was born in 1828; the son of an eminent jurist of the same name, who was a Justice of the New York Supreme Court, and in 1870-71 of the

party that antagonized the President. Since then, the latter did not oppose his confirmation, so that he had that of his brother, Wheeler H. Peckham, who was nominated to the next subsequent Court by Justice S. M.

Until the establishment of the Circuit Court of Appeals by the act of March 3, 1891, the arrears of business before the Supreme Court constantly increased. Since those courts have been in successful operation much relief has been afforded to the Supreme Court, but it will be several years before the docket is cleared. The number of cases docketed at the October term, 1894, was 1,082, of which 1,068 were on the appellate and 16 on the original docket, and 413 were disposed of during the year. The number actually considered by the court was 128, of which 100 were argued orally and 128 were submitted on printed arguments. The following were some of the important cases decided:

Income-tax Cases.—The act of Congress, entitled "An Act to reduce taxation, to provide revenue for the Government, and for other purposes" (called the "Wilson bill"), revised by the President Aug. 13, 1894, which became a law without his signature Aug. 27, 1894, provided that from and after Jan. 1, 1895, and until Jan. 1, 1900, there should be

levied, collected, and paid annually upon the gains, profits, and income received in the preceding calendar year by every citizen of the United States, whether residing in lands or abroad, and every person residing therein, whether said gains, profits, or income be derived from any kind of property, work, interest, dividends, or salaries, or from any profession, trade, employment, or vocation carried on in the United States or elsewhere, or from any other source whatever, a tax of 2 per centum on the amount so derived over and above \$4,000;

and a like tax was imposed upon the gains, profits, and income from all property owned and of every business, trade, or profession carried on in the United States by persons residing without the United States.

The cases of *Pollock vs. The Farmers' Loan and Trust Company* and *Hylle vs. The Continental Trust Company* involving the constitutionality of this act, were argued in the Supreme Court with the case of *Morris vs. Miller*, March 2, 1895, and succeeding days. The argument attracted more attention than any case in the Supreme Court for years, and was participated in by W. D. Guthrie, Clarence A. Seward, Hon. George F. Edmunds, Joseph H. Choate, James C. Carter, Attorney-General Richard Olney, and Assistant Attorney-General Edward B. Whitney. A decision was rendered April 8, 1895, which held that so much of the act as provided for levying taxes upon gains or income derived from real estate or from the interest on municipal bonds was repugnant to the Constitution and was invalid. A tax on income from real estate was held to be a direct tax within the meaning of the Constitution, which requires that direct taxes shall be apportioned among the several States according to population. As to municipal bonds, it was held that as a municipal corporation is the representative of the State, and one of the instrumentalities of the State government, the property and revenues of municipal corporations are for the subjects of Federal taxation, nor is the income derived from State, county, and municipal securities, since

RUFUS W. PECKHAM, JUSTICE OF THE SUPREME COURT.

Court of Appeals. The son was admitted to the bar when very young, and soon became district attorney of Albany County. A few years later he was elected a Justice of the Supreme Court of the State of New York. After serving three years in this post he resigned in order to accept the office of judge of the Court of Appeals. This office he still held when the President, on Dec. 3, nominated him to fill the vacancy on the bench of the United States Supreme Court caused by the death of Justice Howell E. Jackson. Judge Peckham had always been an active Democrat, and since he was not identified with the division of the

taxation on the interest therefrom operates on the power to borrow before it is exercised, and has a sensible influence on the contract, and therefore such a tax is a tax on the power of the States and their instrumentalities to borrow money, and consequently repugnant to the Constitution. On the question whether the whole act was unconstitutional, no opinion was then expressed, the court being equally divided, Justice Jackson not being present. Dissenting opinions were delivered by Justices White and Harlan, also one by Justice Field, who held the whole act to be null and void. A petition for a rehearing was allowed, and the cases were again argued before a full bench, and were decided May 20, 1895. The opinion of the court was delivered by Chief-Justice Fuller, declaring the whole act unconstitutional on the ground that the tax was a direct tax, and was not laid by apportionment as required by the Constitution. Justices Harlan, Brown, Jackson, and White each delivered a dissenting opinion, showing that the court had stood 5 to 4 against the law. This decision deprived the Government of an estimated revenue of about \$30,000,000 annually. It overrules a decision of the same court in the case of *Springer vs. United States* (1880), affirming the constitutionality of the previous income-tax law. In that case the income tax was held in a unanimous opinion to be an excise tax instead of a direct tax and constitutional, Congress having power to lay and collect excises, the only restriction upon its power in this regard being that they shall be uniform throughout the United States.

The aggregate amount collected under the previous income-tax laws (the acts of July 1, 1862, and subsequent amendatory acts which expired by limitation Dec. 31, 1871) was \$346,967,338.12. The largest amount collected in any one year was \$72,982,159.03 (1866). No income-tax laws were passed by Congress prior to the civil war.

Oleomargarine Case.—The case of *Plumley vs. Massachusetts*, decided Dec. 10, 1894, involved the constitutionality of the statute of Massachusetts which prohibits the sale of oleomargarine made in imitation of yellow butter produced from unadulterated milk or cream, in its application to sales of oleomargarine in original packages brought into Massachusetts from other States. It was held that the prohibition in question did not interfere with the freedom of commerce among the several States, and was not repugnant to the Constitution. A dissenting opinion was delivered by Chief-Justice Fuller, in which Justices Field and Brewer concurred.

The Sherman Antitrust Act.—This act was construed in the case of *United States vs. E. C. Knight Company*, which was decided Jan. 21, 1895. The action was brought by the United States in the circuit court for the eastern district of Pennsylvania, to dissolve what is known as the "Sugar Trust." It was unsuccessful in that court, and again in the Circuit Court of Appeals, and the United States Supreme Court affirmed the decisions of those courts, dismissing the suit. The court held that the act of Congress of July 2, 1890, entitled "An Act to protect trade and commerce against unlawful restraints and monopolies," known as "the Sherman Anti-

trust act"—which denounces "every contract, combination in the form of trust or otherwise, or conspiracy in restraint of trade or commerce among the several States or with foreign nations," and prescribes punishments and remedies—has no application to such a combination or monopoly as the Sugar Trust, because that combination or monopoly is engaged primarily in manufacturing, and only secondarily in selling; that a combination to control the manufacturing of a particular article can not be a combination in restraint of interstate commerce such as is within the power of Congress to regulate, but is merely a matter of domestic concern, subject to the police power of the States. Justice Harlan dissented.

The Debs Case.—This case, which was decided May 27, 1895, came before the court on a writ of *habeas corpus*. The sentences of imprisonment in the county jail for terms varying from three to six months, imposed on Eugene V. Debs and three other persons for contempt in disobeying the orders of injunction issued by the circuit court at Chicago during the great railroad strike in July, 1894, were upheld, and principles of great importance were established. The jurisdiction of the courts to issue and enforce injunctions against interference with interstate commerce and the passage of the mails was fully maintained. The circuit court having full jurisdiction in the case, it was held that its action was not open to review by the Supreme Court on *habeas corpus*.

Chinese Exclusion.—In the case of *Lem-Moon-Sing vs. United States*, decided May 27, 1895, the court affirmed the decision of the court below in denying a writ of *habeas corpus* applied for by a Chinese merchant in San Francisco, who made a visit to his native land, and was denied admission into the United States on his return. The constitutionality of the Chinese exclusion act was reaffirmed, and it was held that, under the act of Aug. 18, 1894, the courts had no authority to review the decision of the executive officers of the Government in excluding, under any law or treaty, aliens from admission into this country.

Foreign Judgments.—*Hilton vs. Guyot* involved important questions relating to the effect of foreign judgments. The action was on a judgment recovered in a French court by French citizens against the firm of A. T. Stewart & Co. It was held that foreign judgments were *prima facie* evidence and not conclusive when sued upon in the courts of this country. Chief-Justice Fuller and Justices Harlan, Brewer, and Jackson dissented, holding that the doctrine of *res adjudicata* applied to foreign judgments as well as domestic.

The Army.—The United States army, which is recruited by voluntary enlistment only, consists of 25 regiments of infantry, in 1895 numbering 877 officers and 13,125 men; 10 cavalry regiments, numbering 432 officers and 6,170 men; 5 regiments of artillery, numbering 280 officers and 4,025 men; and 537 officers and 2,386 men in the Engineer Corps, the ordnance department, hospital service, signal service, Military Academy, with Indian scouts, administrative details, etc.; total, 2,126 officers and 25,706 men. (See NATIONAL GUARD, page 504.)

The Navy.—The United States navy contains 6 battle ships, all of the first class. The 2 oldest ("Maine" and "Texas"), launched in 1890 and 1892, displace respectively 6,648 and 6,300 tons, being protected each with 12-inch armor, and making 17 knots an hour, with engines of 9,000 horse power for the heavier vessel, which carries 4 10-inch guns in 2 turrets, with 6 6-inch and 8 6-pounder quick-firing guns; with 7 torpedo ejectors, and 8,000 horse power for the other, which is armed with 2 12-inch guns, one in each turret, and 6 6-inch guns and 12 quick-firing 6-pounders, and has 4 torpedo tubes. Three sister ships ("Oregon," "Massachusetts," and "Indiana"), of 10,200 tons, launched in 1892 and 1893, have 18 inches of armor plating and engines of 9,000 horse power, developing a speed of 15 knots, and carry their 4 12-inch guns in 2 main turrets and 8 8-inch guns mounted in pairs in smaller turrets, with a minor armament of 4 6-inch and 20 6-pounder quick-firing guns and 7 torpedo ejectors. The newest ("Iowa") has a displacement of 11,296 tons and 15 inches of armor, with 11,000-horse-power engines, designed for a speed of 16 knots, and an armament disposed like that of the others, consisting of 4 12-inch, 8 8-inch, 6 4-inch, and 20 quick-firing guns, with 7 torpedo ejectors. Two armored cruisers ("New York" and "Brooklyn"), of 8,200 and 9,270 tons, with side armor 10 and 8 inches thick respectively, besides steel decks, are designed for speed, the one 21 knots, with engines of 17,400 horse power, and the other, with 16,000 horse power, 20 knots, and carry 8-inch guns, 2 forward and 2 aft in inclined turrets, and 1 on either beam in the former, while the other will have 2 additional heavy guns, with a subsidiary armament of 12 4-inch and 12 smaller quick firers on the one, and 12 5-inch and 16 smaller ones on the other. Two commerce destroyers ("Columbia" and "Minneapolis"), of 7,375 tons, carrying 1 8-inch gun, with 2 6-inch, 8 4-inch, and 16 smaller quick firers, have made 22.8 and 23 knots respectively, with engines of 20,000 horse power, and can carry coal for a cruising radius of 26,000 miles. A smaller deck-protected cruiser ("Olympia"), of 5,870 tons, has a speed of 20 knots and an armament consisting of 4 8-inch breechloaders and 10 5-inch and 20 smaller quick firers. A coast-defense armor clad, with 14-inch plates ("Monterey"), of 4,000 tons, has a speed of 17 knots, and is armed with 2 12-inch and 2 10-inch breechloaders and 10 rapid-fire guns. An older vessel, ("Monadnock"), with 11½ inches of armor, classed as a monitor, though having a speed of 14½ knots, carries 4 10-inch guns in 2 turrets. The heaviest of the monitors ("Puritan"), having 14-inch plates and a displacement of 6,160 tons, has 4 12-inch breechloaders mounted in 2 turrets and a secondary armament of 8 quick-firing guns. The next in strength ("Miantonomah," "Amphitrite," and "Terror") have the same armor as the "Monadnock" and a similar armament. A powerful ram, with a speed of 17 knots ("Katahdin"), carries only 4 rapid-fire guns, but is capable of being entirely submerged, except the turtle-back deck, when attacking. Of the old type of monitors, built during the war of secession, there are 13 ("Ajax," "Canonicus," "Catskill," "Co-

manche," "Jamez," "Lalage," "Massachusetts," "Mahopac," "Monadnock," "Miantonomah," "Minneapolis," "Monterey," "Wyandotté"), each armed with 2 12-inch smooth-bore cannons in a single turret. Of the second-class cruisers, 3 ("Newark," "Philadelphia," and "San Francisco"), having a displacement of between 4,000 and 5,000 tons, can make over 18 knots, and are armed with 12 6-inch breechloaders, 4 6-pounder quick firers, and smaller pieces. Two older ones of similar dimensions ("Baltimore" and "Chicago"), one having a speed of 20 knots and the other 15, carry 4 8-inch breechloaders. There are 5 protected cruisers of 3,000 tons or over, of which the latest type ("Babcock" and "Cincinnati") are armed with 10 3-inch and 12 smaller rapid-firing guns, and have a speed of 19 knots; the older ones ("Atlanta," "Boston," and "Charleston"), making 15 to 18 knots, carry 6 6-inch guns, the "Charleston" also 2 8-inch breechloading guns, in their main battery. Three smaller cruisers ("Detroit," "Montgomery," and "Marblehead"), speed 18 knots and carry 2 6-inch, 2 3-inch, and 8 smaller guns. There is a dynamite cruiser ("Venezia"), designed for over 21 knots and armed with 2 15-inch dynamite guns. Of the new steel gunboats, the newest ("Machias," "Cushing," "Hadena," "Nashville," and "Wilmington") carry 8 4-inch rapid-fire guns and an effective auxiliary armament, while the earlier ones ("Beverly," "Concord," "Yorktown," and "Patrol") are armed with 6-inch breechloading cannons, each carrying 6 except the last. Of torpedo boats, there are 6, each provided with 2 18-inch Whitehead torpedo tubes, the latest having a speed of 24½ knots.

Commerce.—The total value of the imports of merchandise during the year ending June 30, 1895, was \$781,368,865, compared with \$684,904,622 in the preceding year. The value of the imports subject to duty was \$668,736,119, compared with \$575,199,086; of articles free of duty, \$243,261,796, compared with \$379,365,548. The value of imports brought in raw and other kind vehicles was \$34,201,866; brought in American vessels, \$108,229,615; brought in foreign vessels, \$560,538,962.

The values of the principal articles or classes of merchandise imported in the fiscal year 1895 were: Animals, \$2,732,979; art works, \$3,943,007; books, maps, etc., \$5,501,607; bristles (1,301,494 pounds), \$1,244,151; brussels, \$2,819,813; chemicals, drugs, dyes, and medicine, \$45,567,009, of which \$30,594,541 were free of duty and \$15,272,096 dutiable; clocks and watches, \$1,319,521; botanicals and plants, \$2,000,000 tons, \$3,848,365; coffee, \$22,339,322 pounds, \$90,120,717; raw cotton, \$4,714,925; cotton manufactures, \$23,296,622; china and earthenware, \$9,356,108; fish, \$4,338,384; flax, hemp, and jute, and manufactures of, \$39,373,655; fruits and nuts, \$17,228,393; furs, \$19,322,557; glass and glassware, \$5,617,623; materials for hats and bonnets, \$2,761,369; hides and skins, \$26,122,642; hops, \$3,332,864 pounds, \$200,744; India rubber and gutta percha, and manufactures of, \$15,625,365; iron and steel, and manufactures of, \$23,045,515; jewelry and gold and silver articles, \$448,610; lead and manufactures of, \$2,688,584; leather and leather manufac-

tures, \$13,819,038; spirituous and malt liquors, \$4,245,586; molasses (15,075,879 gallons), \$1,295,146; musical instruments, \$918,253; paints and colors, \$1,246,924; paper and manufactures of, \$2,863,533; paper stock, \$3,786,026; precious stones and imitations of, including diamonds, uncut, \$7,426,178; salt, \$680,802; silk manufactures, \$31,306,002; raw silk, \$22,626,056; spices, \$2,640,235; sugar (3,574,510,454 pounds), \$76,462,826; tea (97,253,458 pounds), \$13,171,379; tin (47,631,783 pounds), \$6,787,424; tobacco, leaf and manufactured, \$16,888,612; toys, \$1,889,628; wines, \$7,183,537; wood and wood manufactures, \$17,814,119; wool, free of duty, \$23,906,224; wool, dutiable, \$1,560,197; woollen manufactures, \$38,539,890; all other articles, \$68,418,208.

The total value of exports was \$807,538,165. The value of the domestic exports was \$793,392,599. The domestic exports carried in cars and other land vehicles were \$45,353,469; in American vessels, \$60,523,877; in foreign vessels, \$687,515,253.

The principal exports of domestic produce or manufacture and their values in 1895 were: Agricultural implements, \$5,413,075; animals, \$35,754,045; books, maps, engravings, and other printed matter, \$2,316,217; corn (27,691,137 bushels), \$14,640,767; wheat (76,102,704 bushels), \$43,805,663; wheat flour (15,268,822 barrels), \$51,651,928; all other breadstuffs, \$4,496,412; railroad cars, street cars, and carriages, \$2,382,714; chemicals, drugs, dyes, and medicines, \$8,189,142; clocks and watches, \$1,204,005; coal, anthracite (1,397,204 tons), \$5,918,229; coal, bituminous (2,374,988 tons), \$5,180,398; copper ore (10,281 tons), \$1,104,515; copper, manufactures of, \$14,468,703; cotton, raw (3,517,433,109 pounds), \$204,900,990; fish, \$4,501,830; flax, hemp, and jute manufactures, \$1,722,559; apples (818,711 barrels), \$1,954,318; all other fruits and nuts, \$3,017,473; furs and fur skins, \$3,923,130; hides and skins, \$2,310,323; hops (17,523,388 pounds), \$1,872,597; iron and steel manufactures, \$32,000,989; leather and leather manufactures, \$15,614,407; musical instruments, \$1,115,727; naval stores (rosin, tar, turpentine, pitch, and spirits of turpentine), \$7,419,773; oil cake and meal (733,652,495 pounds), \$7,165,587; animal oils (1,467,156 gallons), \$578,445; mineral oil, crude (111,285,264 gallons), \$5,161,710; mineral oil, refined or manufactured, \$41,498,372; vegetable oils, \$7,342,112; paper and paper manufactures, \$2,185,257; paraffin and paraffin wax (95,076,165 pounds), \$3,569,614; beef products (344,600,048 pounds), \$27,478,651; hog products (1,092,024,847 pounds), \$89,754,428; oleomargarine (88,199,775 pounds), \$8,099,482; other meat products, \$1,665,961; dairy products, \$6,632,857; clover seed (22,900,672 pounds), \$2,124,997; other seeds, \$724,148; distilled spirits (3,271,764 proof gallons), \$2,991,686; molasses and sirup (9,148,711 gallons), \$850,400; refined sugar (8,833,522 pounds), \$406,924; tobacco, unmanufactured (300,991,930 pounds), \$25,798,569; tobacco, manufactured, \$3,953,165; vegetables, \$1,548,438; wool and wood manufactures, \$27,115,067; other articles, \$34,154,960.

The imports of gold bullion were \$11,927,983; of American gold coin, \$10,752,673; of foreign gold coin, \$12,466,129; of silver bullion, \$3,480,-

885; of American silver coin, \$100,932; of foreign silver coin, \$5,970,703; total imports of precious metals, \$44,699,254, compared with \$85,735,671 in 1894. The domestic exports of gold bullion were \$793,656; of gold coin, \$55,096,639; of silver bullion, \$40,032,615; of silver coin, \$40,609; total precious metals, \$95,963,517, compared with \$103,556,441 in 1894. The foreign exports of specie in 1895 amounted to \$17,394,983.

Industry and Agriculture.—The following table gives the acreage, yield, and value of the principal farm crops of the United States for 1894, the quantity of tobacco being given in pounds, hay in tons, and the other crops in bushels:

CROP.	Aeres.	Quantity.	Value.
Wheat.....	34,882,436	460,267,416	\$225,902,025
Corn.....	62,582,269	1,212,770,052	554,719,162
Oats.....	27,028,553	662,086,928	214,816,960
Rye.....	1,944,780	26,727,615	18,894,470
Barley.....	3,170,602	61,400,465	27,184,127
Buckwheat.....	789,232	12,668,200	7,040,288
Tobacco.....	528,103	406,678,885	27,760,700
Potatoes.....	2,737,978	170,787,838	91,626,787
Hay.....	48,321,272	54,874,408	468,678,821

The production of malt liquors in 1894 was estimated at 1,016,440,000 gallons; of fermented liquors, 33,362,373 gallons; of rye whisky, 10,026,544 gallons; of bourbon whisky, 15,518,349 gallons; of alcohol, 10,570,070 gallons; of rum, 1,864,595 gallons; of gin, 1,287,977 gallons; of pure neutral spirits, 35,377,115 gallons; of brandy, grape, apple, and peach, 2,948,158 gallons; total spirits 99,153,650 gallons.

The number of sheep in 1894 was 45,048,017. The wool product in 1894 was 298,000,000 pounds, and the consumption of wool 346,654,000 pounds. The number of hogs killed during the year was 21,619,645. The production of tobacco in 1894 was 406,678,385 pounds, valued at \$27,760,739. The cotton crop in 1895 was 5,073,531 bales, compared with 4,811,265 bales in 1894. The consumption of the United States was 3,219,000 bales. The product of cane sugar was 611,156,922; of beet sugar, 45,191,296; of maple, 7,633,036 pounds.

The quantity of pig iron produced in 1894 was 6,657,388 long tons, value \$71,966,364; of copper, 353,504,314 pounds, value \$33,540,489; of gold, 1,923,619 ounces, value \$39,761,205; of silver, 49,846,875 ounces, value \$31,403,531; of zinc spelter, 74,004 tons, value \$5,209,882; of lead, 160,867 tons, value \$10,585,048; of quicksilver, 30,440 flasks of 76½ pounds, value \$1,095,840; of aluminum, 220 tons, value \$490,560; of antimony, 205 tons, value \$39,200; of bituminous coal, 117,950,348 tons, value \$103,842,467; of anthracite coal, 52,010,433 tons, value \$80,879,404; of coke, 8,495,295 tons, value \$12,654,558; of crude petroleum, 48,527,336 barrels of 42 gallons, value \$40,762,962; value of natural gas, \$11,000,000; quantity of evaporated salt, 9,161,053 barrels of 280 pounds, value \$4,608,275; of rock salt, 2,341,922 barrels, value \$788,681; of refractory clay, 3,375,738 tons, value \$4,050,895; of kaolin, 24,552 tons, value \$185,169; of hydraulic cement, 7,895,259 barrels of 300 pounds, value \$4,397,407; of Portland cement, 738,196 barrels, value \$1,080,644; of lime,

50,750,000 barrels of 200 pounds, value \$28,375,000; of gypsum, 287,517 tons, value \$849,935; of copper sulphate, 60,000,000 pounds, value \$2,016,000; of rock phosphate, 952,155 long tons, value \$2,856,465; of white lead, 87,242 tons, value \$8,445,174; of oxide of zinc, 22,814 tons, value \$1,711,375; value of roofing slate, \$2,551,359; of marble, \$2,177,280; of precious stones, \$250,000. The total value of metals extracted was \$194,092,119 and of all mineral products \$553,352,996. The products of manufacture of all kinds in 1890 were valued at \$9,372,487,283; and the products of fisheries were valued at \$45,312,818.

Railroads.—The total mileage of the railroads of the United States in 1895 was 178,054 miles, or, including side tracks and sidings, 232,756 miles. The railroads operated, exclusive of elevated railroads, had a total length of 175,444 miles. The number of passengers carried during the year was 583,248,007; tons of freight, 675,129,747. The gross earnings were \$1,060,265,015, of which \$288,693,073 came from passengers, \$700,477,409 from freight, and \$91,134,533 from miscellaneous sources. The net revenue was \$322,539,276 from traffic receipts, the operating expenses having been \$757,765,739. Other receipts, including rentals, made the total available revenue \$419,016,719. The payments from revenue amounted to \$429,484,953, of which \$297,620,367 were interest on bonds, \$60,900,454 rentals and tolls, \$7,464,971 interest on floating liabilities, \$38,220,492 miscellaneous expenditures, and \$85,278,669 dividends on stock. The total liabilities amounted to \$11,455,220,006, including \$5,027,604,717 of capital stock, \$5,005,775,764 of bonded indebtedness, \$382,327,834 of unfunded debts, and \$438,911,691 of current accounts. The total assets were estimated at \$11,808,425,973, including \$9,693,141,657 cost value of railroads and equipment, \$238,500,500 of real estate, stocks, and other investments, and \$225,612,088 of current accounts.

Shipping.—The vessels under the American flag on June 30, 1895, numbered 23,240, of 4,635,960 tons, of which 1,193, of 822,347 tons, were engaged in foreign commerce; 20,882, of 3,728,714 tons, in domestic commerce; 67, of 15,839 tons, in whaling; and 1,598, of 69,060 tons, in cod and mackerel fisheries. There were built and registered during the year preceding 248 steam vessels, of 69,754 tons, and 397 sailing vessels, of 34,900 tons.

Immigration.—The total number of immigrants that arrived during the year ending June 30, 1895, was 279,948, compared with 314,467 in 1894, 502,467 in 1893, 623,084 in 1892, and 590,319 in 1891. The occupations of the immigrants arriving in 1894 were reported as follows: Laborers, 59,575; servants, 28,763; farmers, 16,472; tailors, 3,184; carpenters, 2,934; miners, 2,505; shoemakers, 2,284; clerks, 2,222; professional, 1,738; total skilled laborers, 33,926; miscellaneous, 116,187. Of the immigrants arriving in 1895 there came 219,006 through New York, 25,862 through Philadelphia, and 20,472 through Boston.

Pensions.—The number of pensioners on the rolls on June 30, 1895, was 967,043, drawing \$129,053,802 in pensions, besides 3,481 living in foreign countries, drawing \$605,353. There were

dropped from the rolls during the year 47,437, of whom 27,816 died. Of the 77,051 remaining 12 were widows and daughters of Revolutionary soldiers, 352,453 army invalid pensioners, 106,220 army widows and minor children, 2,403 navy widows and minors, 31 survivors of the War of 1812, 3,899 widows of soldiers of the War of 1812, 12,586 survivors of the Mexican War, 3,008 widows of soldiers of the Mexican War, 3,612 survivors of the Indian wars before 1841, 3,911 widows of survivors of Indian wars, 696 army nurses, and 105,118 army invalid pensioners, army widows, and minor children, 13,897 navy invalids, and 5,104 navy widows and minor children pensioned under the act of June 21, 1892. The survivors and widows of the War of 1812 received \$545,506; of the Indian wars, \$777,881; of the Mexican War, \$2,295,728.

Public Lands.—During the fiscal year 1896 the homestead entries contained 5,009,393 acres, and entries under the timber-culture act 3,889 acres. The area of the public lands was estimated at 47,409,000 acres. There remained unsurveyed 72,790,554 acres, including Indian reservations, private land claims in Arizona, New Mexico, Colorado, and California, railroad, swamp, and school grants, and unsurveyed lakes, rivers, and mountain areas. The total area vacant and subject to entry on June 30, 1895, including waste lands, was 500,082,895 acres, of which 313,537,888 were in the surveyed areas and 286,545,007 were unsurveyed.

The Bering Sea Seal Fisheries.—Regulations governing seal-fishing for the season of 1895 were agreed upon by the governments of Great Britain and the United States on Jan. 18. Every vessel employed in seal fishing was required to have a special license, to be given only on the production of satisfactory evidence that the hunters engaged were skilled in the use of the weapons used; the sealing vessels must fly a special flag; any vessel crossing the area of the award during the close season could have its hunting outfit sealed up to prevent it against detention; also, the guns and seal outfit could be sealed before entering Bering Sea. On Feb. 25 the President issued the annual proclamation forbidding the killing of fur-bearing animals in Alaska or the waters thereof under penalty of a fine of not less than \$200 nor more than \$1,000, or imprisonment not exceeding six months, or both. Congress failed to appropriate \$400,000, offered by Secretary Graham in satisfaction of the claims of Canadian sealing vessels seized unlawfully by the United States authorities, which claims were figured at \$543,183, after Sir Julian Pauncefote in behalf of the British subjects aggrieved had, on Feb. 13, 1895, accepted the offer. President Cleveland, in his annual message, urged that the payment be sanctioned, or that the claims be arbitrated in accordance with an agreement that the respective governments had entered into. The depletion of the seal herd continued unabated during 1895, owing to the insufficiency of the restrictions imposed by the Paris tribunal—viz., a forbidden zone of 30 mile radius around the Pribiloff Islands and a close season in Bering Sea from May 1 to Aug. 1; also to the ineffective police. Great Britain having only 2 vessels patrolling Bering Sea in 1895.

UNITED STATES, FINANCES OF THE.

The financial operations of the National Government for the fiscal year ending June 30, 1895, though more satisfactory than those of the previous year, still resulted in an excess of ordinary expenditures above ordinary receipts of \$42,805,223. The receipts from customs for 1895 were more than \$20,000,000 greater than in 1894, but those from internal revenue were \$3,500,000 less. The receipts from other sources remained substantially unchanged; the net aggregate of all receipts showing an increase of \$17,570,715.

The following tables show the principal items of receipts and expenditures of the National Government for the two years in question:

RECEIPTS, INCLUDING POSTAL SERVICE.

SOURCE.	YEAR ENDING JUNE 30,	
	1895.	1894.
Internal revenue	\$143,421,672	\$147,111,233
Postal service	76,983,128	75,080,479
Customs	152,158,617	131,818,581
Sales of public lands	1,103,347	1,673,637
Tax on circulation of national banks	1,712,551	1,610,867
Repayment of interest by Pacific railroads	982,411	926,420
Sinking fund for Pacific railways	610,082	1,916,314
Customs fees, fines, penalties, and forfeitures	640,060	692,041
Fees, consular, letters patents, and lands	2,655,299	2,765,699
Proceeds of sales of Government property, except land	178,124	201,971
Profit on coinage	1,640,580	870,017
Revenues, District of Columbia	3,658,048	8,745,423
Immigrant fund	805,225	214,149
Miscellaneous	4,923,153	4,185,724
Total ordinary	\$390,873,203	\$372,802,498
Premiums, public debt	11,839,845	8,693,296
Principal, public debt	895,787,206	417,651,223
Total gross	\$797,499,754	\$799,087,017

EXPENDITURES, INCLUDING POSTAL SERVICE.

OBJECT.	YEAR ENDING JUNE 30,	
	1895.	1894.
Congress	\$7,639,167	\$7,814,781
Executive	11,716,002	11,736,228
Judiciary	8,277,029	6,008,948
Postal service	76,983,128	75,080,479
Deficiency in postal revenue	11,016,542	8,250,000
Foreign intercourse	1,708,863	1,702,307
Improving rivers and harbors	19,597,558	19,887,362
Other expenses, military establishment	81,907,206	84,680,569
Constructing new war vessels	18,182,134	16,199,259
Other expenses, naval establishment	15,615,662	15,502,083
Indians	9,990,751	10,293,482
Pensions	141,893,229	141,177,285
Constructing public buildings, including sites	3,599,614	3,820,840
District of Columbia	6,176,891	5,742,370
Interest on public debt	80,978,080	27,841,406
Heavy on sugar	966,154	12,100,209
Life-saving service	1,884,015	1,287,719
Mint establishment	853,118	1,114,854
Revenue-cutter service	929,887	908,907
Engraving and printing	1,146,552	1,186,924
Lighthouse establishment	2,703,248	3,062,117
Collecting customs revenue	6,508,269	6,561,433
Assessing and collecting internal revenue	3,762,682	3,815,733
Miscellaneous	24,587,204	26,445,514
Total ordinary	\$438,178,426	\$442,605,756
Public debt, principal	854,376,859	831,868,272
Total gross	\$787,435,285	\$773,980,080

The expenditures for 1895 were \$9,427,332 less than for the previous year. The decrease arose mainly from a great reduction in payments on account of the sugar bounty and a considerable reduction in the expenditures for constructing new war vessels and for general expenses military establishment.

In addition to the ordinary revenue, as shown in the table, the cash in the Treasury was augmented during the year by the receipt of \$58,538,500 on account of the sale of \$50,000,000 5-per-cent. bonds (under the act of Jan. 14, 1875); also \$65,116,245 from the issue of \$62,315,400 4-per-cents. for gold purchased, and \$2,470 4-per-cents. issued in liquidation of accrued interest on refunding certificates—in all, \$123,657,215.

Excepting a comparatively small amount of deposits held in national bank depositaries upon ample security of United States bonds, the Government holds and disburses its own revenues. It also holds in trust a reserve of gold and silver coin and bullion to meet the redemption of its paper issues, a fund to redeem certain national bank notes and the deposits of public disbursing officers, subject only to the check of the respective officers; the whole aggregating, on Dec. 31, 1895, the sum of \$787,578,447, equivalent to nearly half of the monetary circulation of the country. Of this amount, less than \$15,000,000 was in national bank depositaries, and of the entire amount only \$178,027,201 was to the credit of the United States Treasurer and subject to his official checks.

The character of the assets held and the several accounts to which the moneys were credited at the beginning and end of the last fiscal year will be seen by the following table:

ITEMS.	Dec. 31, 1895.	Dec. 31, 1894.
<i>Assets:</i>		
Gold coin or bullion	\$118,198,707	\$189,606,354
Silver dollars or bullion	488,696,234	489,751,100
United States notes	115,825,143	81,919,126
Treasury notes (1890)	22,044,511	28,360,390
National bank notes	7,068,187	4,750,972
Balances in national bank depositaries	14,271,280	15,081,275
Gold certificates	163,450	56,990
Silver certificates	9,025,856	5,646,721
Bonds and interest, checks paid	82,079	12,348
Currency certificates (1872)	2,845,000	1,960,000
Minor coins and fractional notes	1,048,729	1,104,197
Subsidiary silver coins	12,764,321	14,483,636
Total	\$787,578,447	\$782,754,290
<i>Liabilities:</i>		
Gold certificates	\$50,099,889	\$58,420,869
Silver certificates	345,702,504	386,924,504
Currency certificates (1872)	34,450,000	48,066,000
Treasury notes (1890)	187,771,280	150,823,781
Redemption national bank notes	7,835,379	7,419,799
Public disbursing officers	80,858,168	28,468,514
Outstanding checks or drafts	2,849,026	3,399,593
General Treasury balance	178,027,201	158,287,500
Total	\$787,578,447	\$782,754,290

Of the general Treasury balance Dec. 31, 1895, \$63,262,268 was represented by gold coin available for redemption of United States notes; Dec. 31, 1894, \$86,244,455 was available for like purpose.

The debt of the United States is represented by obligations either with or without reserve. Of the debt without reserve, there has been an

increase during the last calendar year of \$84,066,363, arising mainly from an issue of \$62,315,400 4-per-cent. loan of 1935, an increase of \$22,982,177 in United States notes having no reserve, and \$6,875,000 of the 5-per-cent. of 1904, and a reduction of \$6,955,716 in the balance due the national bank redemption account.

The items of debt with no reserve for 1895 and 1894 will be seen in the following table:

CHARACTER OF OBLIGATION.	OUTSTANDING, DEC. 31,	
	1895.	1894.
Funded loan of 1891, 4 per cent. continued at 5 per cent.	\$25,364,500	\$25,364,500
Funded loan of 1907, 4 per cent.	550,001,700	550,001,100
Outstanding certificates, 4 per cent.	50,810	54,400
Loan of 1904, 5 per cent.	100,000,000	94,135,000
Loan of 1925, 4 per cent.	62,815,400
Old loans matured.	1,674,510	1,000,000
Outstanding notes.	54,847	54,847
U. S. notes (greenbacks)	293,418,745	290,436,971
National bank redemption account.	22,650,734	23,615,450
Fractional notes.	6,800,304	6,904,022
Total.	\$1,062,008,193	\$977,996,480

Of the debt outstanding having a specific reserve, dollar for dollar, there was a decrease during the calendar year in the amount of United States notes of \$22,982,177, but there was a corresponding increase in the amount of these notes having no reserve. There was also a decrease in Treasury notes of 1890 of \$13,052,444 and an increase in silver certificates of \$8,778,000. The following table shows the items:

CHARACTER OF OBLIGATION.	OUTSTANDING, DEC. 31,	
	1895.	1894.
U. S. notes (greenbacks)	\$62,502,360	\$84,544,445
Treasury notes (1890).	187,771,290	116,928,731
Currency certificates (1872)	24,450,000	48,965,000
Gold certificates.	50,099,280	53,420,600
Silver certificates.	345,792,504	336,994,504
Total.	\$661,245,944	\$676,874,540

The gold and silver coinage is executed by the mints at Philadelphia, San Francisco, and New Orleans, while the minor coinage is confined by law to the mint at Philadelphia. There was a reduction in the value of the gold coinage for the fiscal year ending June 30, 1895, over that of the previous year of \$53,541,437; but there was meanwhile an increase in that of the silver coinage of \$3,069,480.

There is no legal limit to the deposits of gold that the mints can receive for coinage; but those institutions have no authority to receive from the public deposits of silver, except such as are purchased by the Treasury at market rate for subsidiary coinage. The repeal of the authority to purchase silver bullion to be paid for by the issue of Treasury notes (act of 1890) did not take away the authority to coin the bullion thus purchased into silver dollars as might be necessary to redeem the notes, and out of such purchases there were coined during the last fiscal year 3,956,011 silver dollars, costing \$2,640,835, thus yielding a profit of \$1,275,186. Most of the subsidiary coinage was the refabrication of old, worn, and mutilated coins unfit to be issued.

Of the national banks, there has been a decrease during the year of 43 in number, of \$11,000,000 in capital stock, of \$61,000,000 in paid coin and certificates, and of \$37,000,000 in United States notes. The total of bank notes outstanding has increased meanwhile by \$10,000,000.

The following table shows the aggregate resources and liabilities of the banks in detail at the dates named:

ITEMS.	PART OF 1895. \$700,000,000.	DEC. 31, 1894. \$750,000,000.
Resources.		
Loans and discounts.	\$1,000,000,000 00	\$1,000,000,000 00

Grand total.....	53,715,549	106,216,730

UNIVERSALISTS. The statistical tables in the "Universalist Register" for 1896 give this denomination 44 State conventions, 1,009 parishes, 48,030 families, 802 churches with 47,986 members, 967 Sunday schools with 56,394 members, and 834 churches with property valued at \$9,789,037. The 13 universities, colleges, theological and medical schools, and academies return 165 professors and teachers, 1,524 students, and property valued at \$2,787,500. The 12 funds under the care of the General Convention amount in the aggregate to \$263,979. Associated with the General Convention are the Women's Centenary Association or National Missionary Society; the Young People's Christian Union, with 425 affiliated and 8 unaffiliated societies; and the Universalist Historical Society, which has a library of about 4,000 volumes, besides important manuscripts and papers.

The Universalist General Convention met in Meriden, Conn., in October. Statements were presented in an address by the Hon. Henry B. Metcalf, showing that the value of parish property had grown within the past twenty-five years from \$5,000,000 to nearly \$9,000,000; the amount of parish expenses and contributions from \$600,000 to \$1,000,000; the property in schools and colleges from \$1,700,000 to nearly \$4,000,000; the funds of the General Convention from \$38,000, less \$17,000 indebtedness, to \$254,000; and the funds held by the General and State conventions together from \$100,000

to \$690,000. A mission had been founded in Japan, and showed marked power and advance. Contributions had been given during the twenty-five years of \$53,000 to foreign missions, \$47,000 to home missions, \$94,000 to church building, \$63,000 in aid of parish work, and \$184,000 in aid of students. On the recommendation of the Committee on the Revision of the Profession of Faith, the convention voted in favor of the substitution of the following articles for the Winchester profession:

I. We believe in the fatherhood of God, and in the brotherhood of man.

II. We believe that God, who hath spoken through all his holy prophets since the world began, hath spoken unto us by his son, Jesus Christ, our example and Saviour.

III. We believe that salvation here and hereafter consists in spiritual union with God, who, leading to repentance and life by his spirit, will gather in Christ the whole family of mankind.

Final action is to be taken on these articles at the next convention, in 1897. It is represented that more churches were dedicated in 1895 than in any previous year of the life of the denomination. The home-mission work has been extended in the South and Southwest. The mission in Japan includes a central church and a theological school at Tokio, 8 churches in important cities, a school for girls, and several mission stations, some of which are under the care of native pastors educated in the seminary. The sum of \$10,000 was voted by the General Convention for carrying on this work in 1896. The meeting of the Young People's Christian Union held in Boston in July was attended by more than 4,000 members.

UTAH, a Western State, organized as a Territory Sept. 9, 1850; admitted to the Union as a State Jan. 4, 1896; area, 84,970 square miles. Population by the census of 1890, 207,905; estimated population in 1895, 247,324. Capital, Salt Lake City.

Government.—The following were the Territorial officers in 1895: Governor, Caleb W. West; Secretary, Charles C. Richards; Auditor, John T. Caine; Treasurer, T. W. Whitehead, Jr.; United States District Attorney, John W. Judd; Superintendent of Schools, T. B. Lewis; United States Marshal, N. M. Bingham; Adjutant General, G. M. Ottinger; Fish Commissioner, A. M. Musser—Democrats; Chief Justice of the Supreme Court, S. A. Merritt; Associate Justices, G. W. Bartch, H. W. Smith, W. H. King.

Finances.—The final report of the Territorial Auditor shows that the assessed valuation in 1895 was \$97,983,525, and the amount of tax \$489,917.62. The revenue was \$8,089.16 less than that of 1894. The amount of taxes unpaid at the end of the year was \$93,210.25. The bonded indebtedness is \$700,000, and the total excess of liabilities over resources, including the bonded debt, \$836,713.51. The value of the public institutions and other property which the State receives from the Territory amounts to \$1,679,568.46. The Auditor's estimate of expenses for 1896 is \$364,581.43.

Education.—The school population numbers 74,551. The apportionment in January was \$152,829.53; in March, \$126,695.45; in December, \$225,240.10.

The enrollment at the Agricultural College, at

Legion, the first term of the year was 400. The cost of the building and grounds was \$211,947. The expenditure of the past two years on the State account was \$21,861.90. There is a deficit of \$8,930. The Government gives \$26,000 a year for special purposes.

The number of students registered at the University of Utah, Salt Lake City, for the school year 1895-'96 is 503. The estimated expense for a school year is \$35,000. The appropriations heretofore have not been large enough, and there is a deficit of \$13,950. The value of the buildings and grounds is estimated at \$250,000. Originally, the ten-acre square on which the university is situated was given by Salt Lake City under certain conditions, which required that in case the ground should cease to be used for the main buildings of the university, title to the land would revert to the city. In March, 1895, the city council removed this condition, and the only requisite remaining is that the State University be located within or contiguous to Salt Lake City. In 1894 the United States Government granted to the university a 60-acre tract on the Fort Douglas reservation in Salt Lake County on condition that the institution occupy the site within five years. Thus far nothing has been done toward meeting the requirement.

Public Institutions.—The Penitentiary, which passes from the Government to the State, has capacity for 500 prisoners, and is on a farm of 200 acres, 78 of which are under cultivation. There are now 189 convicts. The cost has been a little over \$40,000 a year.

The Reform School, at Ogden, has 57 acres and 2 buildings which cost over \$100,000. The appropriation for maintenance in 1894-'95 was \$13,042.92, and there is about \$6,000 deficit. The first of the buildings, according to the report, was large enough to accommodate at least four times the number of children ever present at one time.

The number of patients at the Insane Asylum, at the end of the year was 217, of whom 107 were women. The average during the year was 214. The number of deaths was 15. The average cost of care and treatment *per capita* was 884 cents daily. The asylum is at Provo. It is a modern and well-equipped building, which has cost, including the 200 acres of land, the furniture, and machinery, \$403,073.91. It can accommodate 250 patients.

The School for the Deaf, heretofore conducted as a department of the university, is to be removed to Weber County, where the School for the Blind will also be placed, according to provisions of the new Constitution.

Industries and Products.—The total number of industrial concerns in Utah is placed at 880, the number employed at 5,054, the wages paid at \$2,027,118, the value of raw material used at \$2,610,038, and the value of product at \$6,678,118.

The capital invested in commercial interests is estimated at \$14,551,345, sales at \$32,863,611, wages paid at \$2,785,794, and the number of concerns at 1,964, with 5,023 employed. The aggregate capital of the banks is \$3,061,890, and the deposits \$9,689,267.

There has been great activity in the search for gold, the Death valley and Little Cotton-

wood being among districts where new strikes have been made. The mineral product of the Territory in 1895 was valued at \$14,141,000. The Salt Lake Mining Stock Exchange was formally opened December 26.

The Constitutional Convention.—The convention for framing a constitution for the State met in Salt Lake City, March 4, with 100 members—57 Republicans and 43 Democrats. There were 5 other claimants for seats. John H. Smith was chosen president and Parley P. Christensen chief clerk. The Constitution as framed was adopted May 6. Among its peculiar provisions were the following:

Eight jurors may sit in judgment, and six may find a verdict.

A day's work, in public employment, is limited to eight hours.

Women are to hold equal rights with men at the ballot box and in eligibility to office.

Polygamy is prohibited in the strongest terms, and the Territorial laws are to be so amended as to enforce by special provisions.

The complete separation of Church and State is decreed, and perfect toleration is enacted of religions in general.

Officers in counties, cities, and townships are prohibited from borrowing money to cover the amount of taxes for the current year, except by the vote of the majority of the citizens therein who have paid a property tax for at least one year preceding.

In general, the Constitution follows the usual lines of State constitutions, the executive departments and the legislative and judicial authorities and functions being distributed under the precedents established by the fundamental law in the other States. The first article is a "declaration of rights, guaranteeing personal liberty, rights of accused persons under prosecution, freedom of speech and of the press, free elections, and the obligation of citizens; declaring subordination of the military to the civil power; prohibiting slavery and the taking of private property for public use without just compensation; and providing that no law shall be passed granting irreversibly any franchise, privilege, or immunity." Section 13 of this article is as follows:

Offenses heretofore required to be prosecuted by indictment shall be prosecuted by information after examination and commitment by a magistrate, subject the examination be waived by the accused with the consent of the State, or by indictment, with or without such examination and commitment. The grand jury shall consist of 7 persons, 4 of whom must concur to find an indictment; but no grand jury shall be drawn or summoned unless in the opinion of the judge of the district public interest demands it.

Article II defines the boundaries of the State. Article III is on religious toleration and on Indian lands and other lands belonging to the Government, disclaiming any right, jurisdiction, or control over them, and providing that they shall never be taxed higher in proportion than lands belonging to citizens of the State; also assuming the debt of the Territory, and declaring that the Legislature shall provide for a system of public schools which shall be free from sectarian control. Article IV is on elections and the right of suffrage. Then follows the usual distinction of the legislative, executive, and judicial departments, and the defining of the rights and duties of each. All general elections are to

be on the Tuesday next following the first Monday in November, and the terms of officers elected begin on the 1st of the following January.

The sessions of the Legislature are to be biennial, beginning, except the first, on the second Monday in January next after the election of members, whose terms are two years for members of the House and four years for Senators, except that half of the Senators first chosen shall be drawn by lot to serve two years only. Twenty-five years is the minimum age. Members can not hold any office of trust or profit from the Government or State, or take any that has been created during their terms; they shall be privileged from arrest during the session, for fifteen days before and in returning, and shall receive not more than \$4 a day and mileage not to exceed 10 cents a mile. No regular session except the first shall exceed sixty days in length, except in cases of impeachment, and no special session last more than thirty days. The House shall have the power of impeachment by a two-thirds vote. Private and special legislation is prohibited in 18 cases.

Legislation is also prohibited releasing obligations to the State or to municipal corporations therein; authorizing lotteries, etc.; delegating power to make or interfere with municipal improvements and the like; granting extra compensation to officers, etc., except in the case of charges incurred by public officers in the execution of the laws; and from authorizing the State or any county, city, town, township, district, or other political subdivision of the State to lend its credit or subscribe to stock or bonds in aid of any railroad, telegraph, or other private individual or corporate enterprise or undertaking.

The Executive Department shall consist of Governor, Secretary of State, State Auditor, State Treasurer, Attorney-General, and Superintendent of Public Instruction, each of whom shall hold his office for four years, beginning on the first Monday in January next after his election, except that the terms of office of those elected at the first election shall begin when the State shall be admitted into the Union, and shall end on the first Monday in January, A. D. 1901.

In case of the death of the Governor, or disability from any cause, the Secretary of State shall be acting Governor; and if he also is unable to perform the duties of the office, they devolve upon the President *pro tem.* of the Senate.

The Governor, Justices of the Supreme Court, and Attorney-General constitute a Board of Pardons; the Governor, Secretary of State, and Attorney-General, a Board of State Prison Commissioners; the Governor, State Treasurer, and Auditor, a Board of Insane-asylum Commissioners; and the Governor, Attorney-General, and Superintendent of Public Instruction, a Board of Reform-school Commissioners. All fees are to go into the treasury.

The Supreme Court is to consist of 3 judges, but may be increased to 5 after 1905. The term, after the first, shall be six years. There are for the present 7 judicial districts. The office of probate judge is abolished. The State is divided for the present into 27 representative and 12 senatorial districts.

The article on education provides that

The public-school system shall include kindergarten schools; common schools, consisting of primary and grammar grades; high schools; an agricultural college; a university; and such other schools as the Legislature may establish. The general control and supervision of the public-school system shall be vested in a State Board of Education, consisting of the Superintendent of Public Instruction and such other persons as the Legislature may provide. Neither the Legislature nor the State Board of Education shall have power to prescribe text-books to be used in the common schools.

The metric system is to be taught; religious tests are forbidden, and "neither the Legislature nor any county, city, town, school district, or other public corporation shall make any appropriation to aid in the support of any school, seminary, academy, college, university, or other institution, controlled in whole or in part by any Church, sect, or denomination whatever."

Corporations for municipal purposes shall not be created by special laws, but the Legislature shall provide by general laws for the incorporation, classification, and organization of towns in proportion to population. Cities are prohibited from selling or leasing waterworks or sources of supply owned or controlled by them, except that they may exchange them for others of equal value.

No railroad corporation shall consolidate its stock, property, or franchise with any other railroad corporation owning a competing line.

The rolling stock and other movable property belonging to any other railroad company or corporation in the State shall be considered personal property, and shall be liable to taxation and to execution and sale.

No corporation or association shall bring any armed person or bodies of men into the State for the preservation of the peace or the suppression of domestic troubles, without authority of law.

The stockholders in every corporation and joint stock association for banking purposes, in addition to the amount of capital stock subscribed and fully paid by them, shall be individually responsible for an additional amount equal to the amount of their stock.

Combinations to control prices are prohibited, and corporations violating this section may be deprived of their franchises.

It is made a crime for any corporation or agent of a corporation to interfere maliciously with the obtaining or retaining of employment by any person.

The article on revenue and taxation provides that a deduction of debts from credits in assessments may be authorized, and exempts public property, property used exclusively for religious worship or charitable purposes, and places of burial not used or held for private or corporate benefit. Ditches and canals are not to be separately taxed when used exclusively for irrigating the property of the owners. Mining claims and mines are to be taxed at the price paid the United States therefor, except when the surface is used for other purposes; machinery, etc., is to be taxed at its value. The rate of taxation shall not exceed 8 mills on the dollar; when the taxable property shall amount to \$200,000,000, it must not exceed 5 mills, and

never exceed 4 mills after the valuation reaches \$300,000,000, unless permission is granted by vote of the electors who paid a property tax the year preceding the election.

Until otherwise provided by law, there shall be a State Board of Equalization, consisting of the Governor, Auditor, Treasurer, Secretary of State, and Attorney-General; also in each county a county board of equalization, consisting of the board of county commissioners.

Nothing in the Constitution shall be construed to prevent the Legislature from providing a stamp tax, or a tax based on income, occupation, licenses, franchises, or mortgages.

The militia shall consist of all able-bodied male inhabitants between eighteen and forty-five not exempt by law.

The Legislature is to provide for a Board of Labor Conciliation and Arbitration, and to prohibit

1. The employment of women, or of children under the age of fourteen years in underground mines.
2. The contracting of convict labor.
3. The labor of convicts outside prison grounds, except on public works under the direct control of the state.
4. The political and commercial control of employees.

The exchange of black lists by railroad companies or other corporations is prohibited.

The right of action to recover damages for injuries resulting in death shall never be abrogated, and the amount recoverable shall not be subject to any statutory limitation.

The Legislature shall provide for the selection, by each head of a family, and exemption of a homestead, which may consist of one or more parcels of land, together with the appurtenances and improvements thereon, of the value of at least \$1,500, from sale on execution.

Women retain their property in their own right after marriage, and it is not to be liable for the debts or obligations of their husbands.

Political.—The Republican convention to nominate officers for the State in 1896 was held in Salt Lake City, Aug. 28. The platform pledged the party in Utah to work for the re-monetization and free and unlimited coinage of silver at the ratio of 16 to 1; favored protection; condemned the bond issue; condemned the administration for failure to open the Uintah and Uncompaghe reservations to settlement; favored the cession of unsold nonmineral lands to States and Territories for aid to irrigation and public schools; favored fixed salaries for public officers; demanded economy in governmental expenditures; approved the proposed State Constitution; demanded that the real estate belonging to the Mormon Church be returned to it; congratulated the women of Utah on the right of suffrage granted; condemned the foreign policy of the national Administration; and concluded:

We denounce the Democratic party of Utah because it stuffed the ballot boxes in Weber, Salt Lake, and Sanpete Counties in its endeavor to obtain control of the Constitutional Convention. We denounce the Democratic members of the Utah commission as accessories to this attempted fraud.

The ticket was as follows: For Governor, Heber M. Wells; Congressman, C. E. Allen;

Judges of the Supreme Court, C. S. Egan, J. A. Miner, and G. W. Barth; Secretary of State, J. T. Hammond; Treasurer, James D. Chiswell; Attorney-General, A. C. Bishop; Auditor, Morgan Richards; Superintendent of Public Instruction, Mrs. Emma J. McVicker. John E. Park was nominated to be the candidate for superintendent, in case it should be decided that women were not eligible.

The Democratic convention assembled at Ogden, Sept. 5. Its platform declared for free coinage of silver, and attributed the panic of 1893 to the Republican party, and declared as cardinal doctrines of Democracy:

1. Absolute acquiescence in the will of the majority as a vital principle of the Democratic party.
2. Total separation of Church and State, for the sake alike of civil and religious liberty.
3. The liberty of the individual, untrammelled by compulsory laws.
4. Support by the State of the public schools.
5. The supremacy of the civil over the military power.
6. Exact equality of all persons before the law.
7. The right to a free ballot—the right preservative of all other rights.
8. That the Democratic party is the friend of the laboring man in every routine of life, and will protect his interest alike against the aggressions of monopoly as well as the common.

The following candidates were nominated: For Governor, John Y. Calne; Congressman, B. H. Roberts; Judges of the Supreme Court, Samuel R. Thurman, Richard W. Young, Thomas Maloney; Secretary of State, Fisher S. Hickey; Attorney-General, A. J. Weber; Treasurer, Alma Greenwood; Auditor, Gray C. Wilson; Superintendent of Public Instruction, Earl G. Mason.

During the political campaign excitement was caused by the utterances of some of the officials of the Mormon Church which were construed as an attempt to influence members of the Church to vote the Republican ticket. This, it was alleged, was done with a view to securing protection and support for certain enterprises in which the Church had a large interest—the Utah Company, the Levi-Singer Works, the Saltair Beach resort, and some large railways and mining enterprises; and it was alleged that a deal had been made with Republican leaders. At a conference of the Mormon priesthood, in Salt Lake City, it was reported that President Joseph P. Smith and George A. Cannon made speeches in which they denounced Mormons who had accepted nominations on the Democratic ticket, particularly Moses Thatcher and B. H. Roberts (for Senator and Congressman). Republicans denied that there was anything in the charge, and asserted that the Democrats were making it in order to account for the defeat in the coming election, which they saw to be inevitable.

On this account the Democratic nomination called another session of the State convention at Salt Lake City, Oct. 22, and the convention issued an address to the people, in which they reviewed the history of the parties in the Territory as related to the Church and the pledges of the Church authorities in 1892 to refrain from all interference or dictation in political matters on the part of the Church; cited instances in which these pledges had been broken;

said that the widespread impression that the officers of the Church desired the success of the Republican party must have a foundation in fact; and made a "Declaration of Truths," the gist of which was: "That a trust is imposed upon each citizen in a free country to act politically upon his own judgment and absolutely free from control or dictation, ecclesiastical or otherwise."

The Populists nominated Henry W. Lawrence for Governor, T. C. Bailey for Secretary, H. O. Young for Auditor, T. L. Jones for Treasurer, J. S. Weaver for Attorney-General, and I. T.

Alvord for Superintendent of Public Instruction.

The question arose whether women might vote at the November election for State officers and on the adoption of the Constitution, and whether they were eligible to office. It was decided in the negative.

The entire Republican ticket was chosen. The vote for Governor stood: Wells, Republican, 20,833; Caine, Democrat, 18,519; Lawrence, Populist, 2,051.

On the adoption of the proposed Constitution, the vote stood: Yes, 31,305; no, 7,687.

V

VENEZUELA, a federal republic in South America, formed in 1830 by the secession of the former Spanish colony of New Grenada from the state founded by Simon Bolivar. There is a Senate of 27 members, 3 from each State, and a House of Representatives, composed of 63 members, elected by direct popular vote for four years. The presidential term is four years. The President is Gen. Joaquin Crespo. The Council of Ministers was composed in the beginning of 1895 as follows: Interior, Gen. J. Ramon Nufiez; Foreign Affairs, P. Ezequiel Rojas; War and Marine, Gen. Ramon Guerra; Treasury, Fabricio Conde; Public Instruction, Dr. Luis Ezpelesin; Fomento, Gen. Augusto Lutowsky; Public Work, David Leon. The Secretary General was Gen. José Antonio Velutini. During the year Dr. J. F. Castillo became Minister of the Interior; Dr. Lucio Pulido, Minister for Foreign Affairs; M. A. Matos, Minister of the Treasury; Dr. A. Urbaneja, Minister of Public Instruction; Gen. Jacinto Lara, Minister of Fomento; and J. M. Maurique, Minister of Public Works; while Dr. J. R. Nufiez was made Secretary General. In December the Cabinet was reconstructed again, when Ezequiel Rojas returned to the Ministry of Foreign Affairs, Enrique Perez became Finance Minister, Bruzual Serra was appointed Minister of Public Works, Federico Chirenos Minister of Instruction, and Tosta Garcia became Minister of Fomento.

The estimated area is 593,943 square miles. The population in 1891 was 2,323,527. The number of foreigners was 42,898. The native Indian population is estimated at 326,000, of whom 240,000 are civilized. Caracas, the capital, had 72,429 inhabitants in 1892.

Finances.—The budget for 1895-'96 estimates the revenue at 34,179,990 bolivars, or francs, of which 23,838,000 are derived from import duties, 162,000 from other customs duties, 5,000,000 from internal-revenue taxes, and 5,179,990 from incomes. The expenditures of the various departments are estimated as follow: Interior, 8,473,388; Foreign Affairs, 1,686,290; Fomento, 1,610,504; Public Instruction, 3,723,000; Public Works, 3,237,108; Finance, 11,805,264; War and Marine, 4,644,376 bolivars; total, 34,179,990 bolivars. The public debt in 1895 amounted to 136,371,378 bolivars, of which 20,236,874 bolivars represent the consolidated internal national debt, paying 5 per cent interest; 20,009,086 bolivars, a new internal 6-

per-cent. loan, issued July 16, 1894; 5,000,000 bolivars, certificates paying 1 per cent. a month; 67,147,325 bolivars, the foreign debt, paying 3 per cent.; and 4,978,090 bolivars, debt due to Spain, France, and Germany.

Commerce and Communications.—The values of the principal exports in 1894 were: Coffee, 84,769,000; cacao, 9,651,000; gold, 2,884,000; hides, 2,849,000; animals, 1,142,000 bolivars.

There were 385 miles of railroad in operation in 1894. The state telegraphs had a length of 3,880 miles. The number of messages in 1894 was 208,965; expenses, 1,080,966 bolivars.

Defense.—By a decree of Aug. 4, 1893, the strength of the army was fixed at 18 battalions, each battalion containing 6 companies of 60 men. The effectives in 1893 numbered 7,280 officers and men. Every citizen between the ages of eighteen and forty-five is enrolled in the national militia. Of this force, 60,000 men have been mobilized at one time. The number of citizens liable to serve is estimated at 250,000.

There is a fleet of 4 steamers and 2 sloop gunboats. To each steamer is attached a company of marine infantry.

Revolutionary Attempt.—An uprising against the Government of President Crespo, in the interest of Dr. Rojas Paul, was started in the autumn. His most prominent opponents would not countenance a political disturbance at a time when the boundary dispute with England was in so critical a state. The revolution was planned to take place simultaneously in Caracas, and in the States of Bermudez and Lara on the night of Nov. 10. The authorities had been warned, and within an hour most of the leaders were in custody and their followers dispersed. Gen. Yaguaracuto, one of the military chiefs of the revolutionary uprising, was taken to Caracas as a prisoner. Gen. Diaz and Gen. Menendez, members of the council of war, fled to Curaçoa. Four members of the Cabinet who were suspected of complicity were dismissed from office. A few bands of guerrillas under Gen. Amparan and Gen. Platero remained unsubdued in the mountains.

Diplomatic Rupture.—Some of the European diplomatic representatives, impatient at the delay of Venezuela in acting upon their claims for damages due their nations arising out of the revolution of 1892, suggested to their respective governments the organization of a

mixed tribunal to pass upon unpaid claims. Offended at this, President Crespo, in March, 1895, sent their passports to the Belgian and French ministers, the only ones then present in Caracas. Afterward he sought to resume diplomatic relations with France, explaining that the French minister was dismissed as *persona non grata*, but it was not till December that the French Government decided to renew relations, requiring as a condition that the same minister be received and an apology rendered. Spain, as well as France, was importunate for payment of these claims. Germany pressed another demand, the payment of the 7-per-cent. guaranteed interest on the German railroad between Valencia and Caracas, and in December sent a squadron to Venezuelan waters.

Guiana Boundary Dispute.—The first settlements in Guiana, the country north of the Amazon and east of the Orinoco, discovered by Vasco de Nufiez in 1504, or perhaps by Columbus in 1498, were planted by the Spaniards in 1500 along the Orinoco. Spain claimed the whole of Guiana by right of discovery and by virtue of the bull of Pope Alexander II dividing America between Spain and Portugal. In 1580 the Dutch, then subject to the Spanish Crown, established a settlement on the Pumeron river, and soon afterward founded one at Wapari. Later still they attempted to settle on the west bank of the Essequibo, but were driven off by the Spaniards. The English under Sir Walter Raleigh sought the gold region, but failed; and in 1630 they attempted to found a settlement at Surinam. The French, with better success, founded one at Paramaribo, and when they abandoned this for Cayenne the English occupied the site in 1652. This territory was ceded in 1667 to the Dutch, who meanwhile had developed flourishing plantations on the Berbice, Demerara, and Essequibo rivers.

When the Netherlands finally achieved its independence from Spain the Treaty of Münster, signed Jan. 30, 1648, confirmed the right of the Dutch settlers in Guiana to the territories already possessed or colonized, but prohibited them from navigating or trading in the bays or places provided with fortifications, warehouses, or castles. Notwithstanding the treaty, the Dutch sought continually to establish new posts, which the Spaniards endeavored to break up by armed expeditions. The Dutch traded with the Caribs, who were hostile to the Spaniards. Their posts, from which the Spaniards ejected them, extended along the coast as far west as the river Barima, and into the interior on the rivers Essequibo, Cuyuni, Pumeron, Waini or Guaima, and Barima. The West India Company laid claim to the whole coast up to the mouth of the Orinoco. The first Spanish settlement south of the Orinoco was San Thome de Guayana, founded in 1590. No other permanent settlements were established till after 1733, when Capuchin missions were organized in the district between the Yumari and the Orinoco. The Spaniards traded with the Indians on the Cuyuni, causing the Dutch West India Company in 1730 to issue an edict prohibiting trade on the rivers Cuyuni and Mazaruni except to their own agents.

The Dutch built forts on Pumeron river and

in the valley of the Essequibo, the latter one near the mouth of Cuyuni river. The ruins of one were discovered also by Sir Robert Schomburgk at Point Barima. It was a post that the Dutch held for a time, until the Spaniards became aware of the encroachment or thought proper to dislodge them, when they were expelled and their fort was destroyed. Their only settlements west of the Essequibo were at the mouth of the Pumeron, from which a Spanish force attempted to expel them in 1797 without success.

The Treaty of Utrecht in 1713 confirmed the provisions of the Treaty of Münster. In the extradition treaty of Arras, between Spain and the Netherlands, June 22, 1791, the Dutch colonies were specified as Paramaribo, Demerara, Berbice, and Surinam, while the territory of the Orinoco was described as Spanish.

The English seized Dutch Guiana in 1795, restored it in 1796, and occupied it again in 1798, and in 1814 the Netherlands, in the Treaty of London, formally ceded to England the settlements of Berbice, Demerara, and Essequibo. The Spanish colonies revolted in 1809, and in 1845 the independence of Venezuela, which had seceded in 1800 from the United States of Colombia, was finally recognized by Spain.

After this part of Guiana became a dependency of the British Crown the whole colony continued to trade with the Indians on the effluents of the Essequibo and the British made treaties with some of the tribes, engaging to protect them from the Spaniards. In 1808, after 2 British vessels had run aground in the Grand Beck of the Orinoco, Sir Robert Kerr Porter, British *chargé d'affaires* at Caracas, requested a beacon at Point Barima.

Robert H. Schomburgk, who traveled in Guiana under the auspices of the Royal Geographical Society in 1840-50, drew a map of the frontiers of British Guiana, making the Anacura the boundary in the north, and the Cotigua (from its source to Mount Karamat) the dividing line from Brazil, and taking in a great part of the course of the Cuyuni and nearly the whole length of the Mazaruni. It was based on accounts given by the Indians of their former relations to Dutch traders and on discoveries of ruined fortifications, with the bounds adjusted to geographical features, such as mountain ridges and water courses. To Venezuela was left only the region over which the influence of the Capuchin missions extended. The Venezuelan Government, alarmed at the extension of the British boundaries shown in Schomburgk's map, appointed Dr. Fortique minister to London in 1841 for the express purpose of arranging a settlement of the boundary. At the same time the British Government commissioned Schomburgk to survey and describe the limits, and he began to set up boundary posts at Point Barima and elsewhere along the line. Before Fortique made strong representations regarding these boundary marks, demanding that a settlement of the boundary by treaty precede the demarcation; to which Lord Aberdeen replied: "The marks and flags established by Engineer Schomburgk were in no way intended as an encroachment or a desire on the part of England to occupy the territory, but simply as a means

of preparing for the discussion of the boundary question between Venezuela and England, and not done, as Venezuela seemed to fear, with the intention of indicating dominion or empire." He expressed satisfaction that the colonial authorities at Demerara had not occupied Point Barima; and when Señor Fortique demanded that the monuments set up by Schomburgk be removed the British Government, on Jan. 31, 1842, sent orders to that effect. Sir Robert Schomburgk was directed at the same time to continue the survey, which he completed in 1844. The Venezuelan Government took the ground that all Guiana originally formed part of the Spanish captain generalcy of Venezuela, and that the part ceded to Holland (which Holland had transferred to Great Britain) comprised only the territory settled and ruled by the Dutch, whose westernmost settlements were confined to the banks of the Essequibo, except near the coast, where they extended to the Pumeron river. In 1841 a case came up in the Demerara court, touching jurisdiction over Maroco river, where a murder had been committed, and the court held that that place was within Venezuelan jurisdiction. On July 29, 1843, Lord Aberdeen suggested arbitration of the boundary dispute. In 1844 he offered to accept Maroco river as the starting point of a conventional boundary, which in the interior should follow the Cuyuni river to its source. Dr. Fortique would not concede a more northern boundary than Pumeron river, and his death, in 1844, interrupted the negotiations.

Some years later the Venezuelan Minister of Foreign Affairs interrogated the British *chargé d'affaires* as to the rumored intention of Great Britain to build a fort at Point Barima. Belford Hinton Wilson replied that his Government had no intention to occupy or encroach upon the territory in dispute, and expected the Venezuelan Government to instruct the local authorities in Guiana to refrain from taking measures which the British authorities might justly regard as aggressive, and which would lead to a collision. In response to his request and formal declaration, made under instructions, that "Great Britain has no intention to occupy or encroach upon the territory in dispute," the Venezuelan minister, on Nov. 18, 1850, entered into a mutual engagement with him to treat such territory as neutral and inviolate pending a settlement.

Owing to the civil war in Venezuela, boundary negotiations were not resumed till 1876. Venezuela then offered to accept the Maroco line that Lord Aberdeen had proposed, but this offer was rejected by Lord Salisbury. An alleged naval demonstration at the mouth of the Orinoco formed the subject of a letter from the Venezuelan minister in Washington, dated Dec. 21, 1879, to which Mr. Evarts, Secretary of State, on Jan. 31, 1880, replied: "I have to inform you that, in view of the deep interest which the Government of the United States takes in all transactions tending to attempted encroachments of foreign powers upon the territory of any of the republics of this continent, this Government could not look with indifference on the forcible acquisition of such territory by England."

In 1881 Lord Granville offered to Venezuela a boundary line beginning 29 miles southeast of

Point Barima, thus resigning all territorial claims over the mouth of the Orinoco. Inland it followed the upper course of Cuyuni river, like the Aberdeen line. This proposition, being less favorable to Venezuela than the previous one, was refused, and the boundary question did not come up again till 1882, but the discussion became acute after gold had been discovered, in 1883, on one of the affluents of Mazaruni river, and miners began to flock into the country.

Venezuela concluded in 1882 that the only solution open to her was arbitration. Since the laws and the Constitution of the republic designated the Essequibo as the eastern boundary, no compromise line short of it would be acceptable or legal, whereas the decision of an international arbiter as to the true boundary would be binding and satisfactory. The Venezuelan minister in London was instructed, on July 15, 1882, to suggest arbitration, and President Guzman Blanco, in November of that year, communicated the state of the negotiations to the Secretary of State at Washington, together with a copy of an intended note proposing arbitration, requesting advice from the United States Government and such support as it was deemed possible to give. Mr. Frelinghuysen, in a dispatch to the minister in Caracas, intimated the willingness of the United States to use its good offices to promote arbitration, though not to approach Great Britain as the advocate of any prejudged solution in favor of Venezuela. He desired the minister to say to the Foreign Secretary in Caracas that "the United States, while advocating strongly the recourse to arbitration for the adjustment of international disputes affecting the states of America, does not seek to put itself forward as the arbiter; that, viewing all such questions impartially, with no intent or desire to prejudice their merits, the United States will not refuse its arbitration if desired by both parties; and that, regarding all such questions as essentially and distinctively American, the United States would always prefer to see such contentions adjusted through the arbitrament of an American rather than a European power."

On Nov. 15, 1883, the Venezuelan Government proposed to submit the frontier dispute to arbitration, saying that it was necessary to have the decision of an impartial referee, since the Constitution of the republic forbade the alienation of any part of the national territory. Col. Mansfield, then British minister at Caracas, replied, on March 29, 1884, that the dispute was not a proper subject for arbitration, and Guzman Blanco went to London as minister plenipotentiary for the purpose of reaching a settlement, if possible. On his way he stopped in Washington and conferred with the Secretary of State, who instructed Mr. Lowell to use his discretion as to how far his good offices could be profitably employed, but, at any rate, to "take proper occasion to let Lord Granville know that we are not without concern as to whatever may affect the interests of a sister republic on the American continent and its position in the family of nations." Gen. Blanco suggested to the British Government, as an alternative to arbitration by a third party, that the question be submitted to a commission of jurists appointed by both parties. This Lord Granville found incompatible with the British Constitu-

tion. Lord Granville declared that Great Britain's object was not to obtain Venezuelan territory, but to determine where the line ran, and he finally agreed to a general arbitration of the questions pending between the two countries. But before the convention was signed the Marquis of Salisbury, on June 24, 1885, became Minister of Foreign Affairs, and refused to confirm this agreement with Venezuela.

Lord Rosebery, who became Foreign Secretary under Gladstone, Feb. 6, 1886, proposed a boundary line that should start from the seacoast west of the river Waini, but this was rejected, on the ground that it would decide once for all the boundary question in a manner unfavorable to Venezuela.

Meanwhile Michael McCurt, with a body of police from Demerara, took possession of Point Barima and entered the rivers, posting notices on the trees indicating British dominion. He informed Mr. Kelly, manager of the Manoa Company, which had obtained from the Venezuelan Government mining rights and land titles extending up to the border of British Guiana, that Barima river was in British Guiana, and he wrote to C. C. Fitzgerald that the whole territory between the Maroco and the Amacuka rivers was a part of British Guiana. A notice was published in the London "Gazette" on Oct. 21, 1886, giving warning that, whereas the boundary line was in dispute, it having come to the knowledge of the British Government that grants of land within the territory claimed by it had been made in the name of the Government of Venezuela, no land title or other right affecting land within the territory claimed as part of the colony of British Guiana would be admitted.

The Venezuelan Government complained that the British authorities had executed solemn acts of jurisdiction in places admitted to be in dispute, thus violating the agreement of 1850, to which the British minister replied that Venezuela had exercised such jurisdiction, also breaking the agreement.

Señor Urbaneja, the Venezuelan Foreign Minister, urging that the Manoa grant could not have given Great Britain cause of complaint, since the concession embraced no land that was in dispute, and had, moreover, expired, declared that diplomatic relations with Great Britain would be broken off unless the occupation of Point Barima, admitted by Sir John Ker Porter in 1836 to belong to Venezuela, and of other points in the disputed territory, should cease. The British minister, F. R. St. John, replied that he was unable to explain the proceedings of the authorities of British Guiana or to discuss them without instructions, and said that his Government was not bound by the unauthorized admission of a diplomatic agent made fifty years before. Lord Salisbury subsequently instructed the minister to say that Great Britain would not object even then to the erection of a lighthouse on Point Barima for the benefit of commerce, as the British consul requested in 1836, provided that it would not be construed in any way prejudicial to the British claim to the territory in dispute. With the object of preventing a rupture of diplomatic relations between Great Britain and Venezuela Secretary Bayard, in December, 1886, instructed the United

States minister in London to render the arbitration of the United States, seeing that it was done "with the least hesitancy as the dispute turns upon simple and readily ascertainable historical facts." The relations of the United States to the matter were explained as follows: "The attitude of friendly neutrality and entire impartiality touching the controversy, consisting wholly of a difference of facts between our friends and neighbors, is entirely consistent and compatible with the sense of responsibility that rests upon the United States in relation to the South American republics. The doctrine was announced two generations ago, at the instance and with the moral support and approval of the British Government, here lost some of their force or importance in the progress of time, and the governments of Great Britain and the United States are really interested in preserving a status the wisdom of which has been demonstrated by the experience of more than half a century." The Spanish Government and several of the South American republics also offered their good offices, and the Pope offered also to act as arbitrator. His offer and that of the United States were declined by Great Britain. The President of Venezuela appointed Dr. Juan Muñoz Tejada and Gen. Rodil commissioners to investigate the acts of encroachment by Great Britain. Acting on their report, Minister Diego R. Urbaneja, on Jan. 26, 1887, requested that Great Britain had violated the convention that was her own suggestion by entering the Waini, Morajana, Amacuka, and Barima rivers and posting notices on the banks proclaiming that her laws were in force there, by sending a Venezuelan commissioner within Venezuelan jurisdiction and carrying him off to Georgetown to be tried and fined, by establishing a public office in Amacuka, by crossing in a revenue cutter between the Amacuka and the Barima, by sending a magistrate to decide on criminal and police cases there, by authorizing the working of mines on Venezuelan territory, and finally by appropriating said territory on the pretext that a dispute regarding limits is pending. The Venezuelan minister accordingly demanded in the name of the President that the British evacuate the territory from the mouth of the Orinoco to the Putumayo. By Feb. 29, 1887, the date for the assembling of the congress; otherwise the diplomatic relations of the two countries would be severed. In the final note dismissing the British minister, Señor Urbaneja reconstituted the case of Venezuela and presented before the British Government and before all civilized nations against the British acts of aggression, "which Venezuela would never recognize as affecting the rights she had inherited from Spain, and will ever be willing to submit to the decision of a third power." Since then official communications between the two governments have been presented through the German minister at Caracas.

Secretary Bayard, having been informed in February, 1888, that the Government of British Guiana, by formal decree, had laid claim to the territory traversed by the route of a proposed railroad from Ciudad Bolívar to Guayaquil, wrote to the United States minister in London: "The claim now stated to have been put forth by the

authorities of British Guiana necessarily gives rise to grave disquietude and creates as apprehension that the territorial claim does not follow historical tradition or evidence, but is apparently indefinite." He intimated anew the great gratification that it would afford the United States Government to see the Venezuelan dispute amicably and honorably settled by arbitration or otherwise. After pointing out that Guasipati lies considerably westward of the line officially claimed in 1887, which followed the Yuruari and itself made a wide detour to the west of the line given out by the Colonial Office ten years earlier, Mr. Bayard concluded: "If, indeed, it should appear that there is no fixed limit to the British boundary claim, our good disposition to aid in a boundary settlement might not only be defeated, but be obliged to give place to a feeling of grave concern." Information having been received in 1889 that Barima had been declared a British port, Secretary Blaine authorized the acting minister in London to confer with Lord Salisbury, with a view to the re-establishment of diplomatic relations between Great Britain and Venezuela on the basis of the temporary restoration of the *status quo*. In May, 1890, the Secretary telegraphed to Mr. Lincoln to use his good offices to bring about the resumption of diplomatic intercourse as a preliminary step toward the settlement of the boundary dispute by arbitration, and to that end he suggested an informal conference in Washington or London of representatives of the 3 powers in which conference the position of the United States would be "one solely of impartial friendship toward both litigants." The minister was instructed to do all that he could consistently with such an impartial attitude, to bring about some accord between the contestants by which "the merits of the controversy can be fairly ascertained and the rights of each party justly confirmed." Without expressing an opinion as to what those rights were, the Department of State "was confident that the shifting footing on which the British boundary question has rested for several years past is an obstacle to such a correct appreciation of the nature and grounds of her claim as would alone warrant the formation of an opinion."

With the development of mining, the boundary claim of Great Britain continued to be moved farther west. Venezuela was forced by British aggressions to resume the negotiations, which were reopened in 1890 through the Venezuelan minister in Paris and a special envoy. The latter went to London with a view to the resumption of regular diplomatic relations, and was received by Lord Salisbury through the good offices of the minister of the United States; but the mission failed because a condition of such resumption that Venezuela steadily adhered to was the reference of the boundary dispute to arbitration. When, in his interview with the British minister, the Venezuelan commissioner broached the subject of the boundary dispute, he was informed that "England is not aware that any such nation as Venezuela exists, and does not admit that there is any question pending between the two countries." The line claimed by Lord Salisbury at that time began at the mouth of the Amacuka, west of Point

Barima. Señor Michelena, a confidential agent of Venezuela, reopened informal negotiations in London in 1893. Lord Rosebery carried the frontier west of the Amacuka and in the interior as far as the source of Cumano river and the sierra of Usupamo, and offered to arbitrate regarding territory west of that line. The Venezuelan agent abandoned his fruitless mission in October, 1893, leaving at the Foreign Office a declaration protesting against the proceedings of the colony of British Guiana as encroachments upon the soil of the republic, and also against the claim of the British Government that that part of the territory belonged to British Guiana, and laying upon the British Government the responsibility for the incidents that might arise in the future from the necessity to which Venezuela was driven to oppose the dispossession of a part of her territory and provide for her legitimate defense.

After the failure of the Michelena mission Venezuela repeatedly brought the controversy to the notice of the Government in Washington, insisting on its importance to the United States as well as to Venezuela, and represented it as having reached an acute stage. The minister at St. James's was informally instructed to exert all his influence in the direction of the re-establishment of diplomatic intercourse and in favor of arbitration. On July 13, 1894, Secretary Gresham wrote to Mr. Bayard: "I can discern but two equitable solutions of the present controversy. One is the arbitration of the rights of the disputants as the respective successors of Holland and Spain over the region in question. The other is to create a new boundary line in accordance with the dictates of mutual expediency and consideration. The two governments having so far been unable to agree upon a conventional line, the consistent and conspicuous advocacy by the United States and England of the principle of arbitration and their recourse thereto in settlement of important questions arising between them, makes such a mode of adjustment especially appropriate in the present instance."

The authorities of British Guiana in 1894 established a police station at Yuruan, at the junction of the Yuruan and Yuruari rivers, 100 miles beyond the Schomburgk line and outside of the Aberdeen and Granville lines, or any line previously claimed by Great Britain. Warning was sent from the Venezuelan military post on the opposite side of the Cuyuni that the upper Cuyuni district was administered by Venezuela and never had been claimed by Great Britain. In September a party went over and arrested Inspector Barnes and Subinspector Baker, carrying them to Upata for trial. As soon as the facts became known in Caracas peremptory orders were sent for the release of the prisoners, who were thereupon conducted back to the place where they had been captured, and were repaid for the loss of clothes and other property. The English hauled down the Venezuelan flag and raised their own again. The leaders of the raiding party were ordered to Caracas, and were there severely punished. In October, 1895, England demanded an indemnity of £12,000 for "the arrest and imprisonment of 2 English subjects on English territory." Vene-

ALTO PIRENEO (1904) VENEZUELA.

zuela had immediately informed the London Government of the reparation already made, and President Crespo demurred to paying an indemnity, and especially to the form in which it was demanded, implying an acknowledgment of British sovereignty over Yuruan. Great Britain then proposed arbitration of the question; but to this Venezuela would not agree, because it would likewise assume that the incident occurred on British territory.

Mining began in 1886, and since the rupture the invading miners have advanced up Cuyuni river beyond the Schomburgk line until they have reached the district of the Callao mine, owned in great part by the English firm of Rothschild, which has long been worked, producing \$30,000,000, by a company that holds its concession from and pays royalties to the Venezuelan Government. All the streams flowing into the Cuyuni, the Mazaruni, the Barima, and the Amacuka are rich in gold. The work is largely done for the English miners by imported coolie contract laborers. The output rose from \$112,000 in 1886 to nearly \$500,000 in 1888. The product for the first five years was \$2,272,000. In 1893 \$2,400,000 was taken out; in 1894, \$2,485,000. About 10,000 laborers were employed in the diggings in 1895. The richest field is the Yuruari district, the farthest within the Venezuelan claim, bordering on settled Venezuelan territory, and this is now entirely covered by English mining claims. The only mining in British Guiana is in this part of the disputed territory that lies mostly west of the Schomburgk line, and was never claimed nor visited by England until after the gold discoveries. The British colonial authorities look to this new industry of gold mining, at the extreme limit of their territorial claim in this region, to retrieve the decay and bankruptcy of British Guiana, where, in spite of the gold exports, the total exports have fallen off from \$12,600,000 in 1891 to \$11,700,000 in 1894, so rapid is the decline of the sugar industry, which has been the colony's only source of wealth, and has not been resuscitated by supplanting free negro labor with contract coolie labor. The sugar estates are rapidly going out of cultivation, the acreage having diminished from 79,500 acres in 1884 to 69,800 in 1894 and about 60,000 in 1895, when the process still continued at a more rapid rate, with the prospect of a reduction of 10,000 acres more in the course of another year. Hence Joseph H. Chamberlain, the British Colonial Secretary, has urged the building of a road from the Barima to the Cuyuni for the development of the northwest district of British Guiana, as the mining region is called. In a dispatch to the Governor of British Guiana in September, 1896, he said it would be necessary, in order to provide adequately for the safety of the district and secure it against incursion, to strengthen the existing police and to erect barracks at Yuruan and at one or two other points. When the Court of Policy considered a proposition of the Colonial Government prompted by this message to buy quick-firing and Gatling guns and send one of the latter to the frontier, it was vigorously opposed by the elective members, who thought it would be folly to make a show of force on the Venezuelan frontier, which could

only be reached by three weeks' traveling through the bush, one of them prophesying that the first news they would get of the Gatling gun would be of its being exhibited as a curiosity in Ciudad Bolivar. Mr. Chamberlain, considering that there was not enough capital in British Guiana or among the adventurers who were attracted to the gold fields to develop the mines with desirable rapidity, set about seeking a syndicate in England prepared to purchase for a capital sum the concession of a fair portion of the gold field in the northwest district. The white or European-born population of British Guiana in 1891 was 2,533, while there were 99,615 Africans, 105,465 East Indians, and 3,714 Chinese.

Besides Callao, there are other mines in Venezuelan Guiana worked by French, English, and Venezuelan companies. Except in the towns and mining settlements, the country is inhabited only by a few primitive tribes. The immense forests of the upper Cuyuni district, rich in quinine, rubber, cinnamon, and sarapia, are unexploited, owing to the lack of transportation facilities. A railroad has been projected to run 170 miles from the Orinoco to the Yuruan, passing through the towns of St. Felix, Upata, Guasipati, and Caratal. American companies have obtained concessions for the development of the lands, forests, and mines in this region. The Orinoco Company has a grant of 14,400,000 acres. The Manoa grant, which lapsed and was afterwards resuscitated, covered about 14,000,000 acres near the mouth of the Orinoco.

The United States Congress, on Feb. 22, 1895, in a joint resolution, declared that "the President's suggestion that Great Britain and Venezuela refer their disputes as to boundaries to friendly arbitration be earnestly recommended to the favorable consideration of both parties in interest."

On July 20, 1895, Secretary Olney sent a letter to the American ambassador at London, in which he said it is impossible to treat the Schomburgk line as a matter of right, or as anything but a line originating in considerations of convenience and expediency; that the various other boundary lines suggested by Great Britain were proposed as conventional lines to which the assent of Venezuela was desired, not demanded as a matter of right; and neither party stands for a boundary line predicated upon strict legal right, Great Britain having formulated no such claim, and Venezuela insisting on the Essequibo line only as a concession to Great Britain, granted out of moderation and prudence. The Secretary of State analyzed the situation as follows:

1. The title to territory of indefinite, but confessedly very large extent is in dispute between Great Britain on the one hand and the South American republic of Venezuela on the other.

2. The disparity in the strength of the claimants is such that Venezuela can hope to establish her claim only through peaceful methods—through an agreement with her adversary either upon the subject itself or upon an arbitration.

3. The controversy, with varying claims on the part of Great Britain, has existed for more than half a century, during which period many earnest and persistent efforts of Venezuela to establish a boundary by agreement have proved unsuccessful.

4. The futility of the endeavor to obtain a conventional line being recognized, Venezuela for a quarter of a century has asked and striven for arbitration.

5. Great Britain, however, has always and consistently refused to arbitrate, except upon the condition of a renunciation of a large part of the Venezuelan claim and of a concession to herself of a large share of the territory in controversy.

6. By the frequent interposition of its good offices at the instance of Venezuela, by constantly urging and promoting the restoration of diplomatic relations between the two countries, by pressing for arbitration of the disputed boundary, by offering to act as arbitrator, by expressing its grave concern whenever new alleged instances of British aggression upon Venezuelan territory have been brought to its notice, the Government of the United States has made it clear to Great Britain and the world that the controversy is one in which both its honor and its interests are involved and the continuance of which it can not regard with indifference.

The United States had already done all that a purely sentimental interest in the affairs of the two countries justifies, but the Secretary pointed out that the settled national policy, based upon the principle of international law that a nation may justly interpose in a controversy between other nations whenever what is done or proposed is "a serious and direct menace to its own integrity, tranquillity, or welfare," imposed the right and duty upon those charged with the interests of the United States to see that the integrity of the Venezuelan territory is not impaired by the pretensions of its powerful antagonists. Washington, in his farewell address, warned his countrymen against entanglement in the politics or the controversies of European powers, and President Monroe, in his message to Congress of Dec. 2, 1823, completed the outline of a distinctive American policy, which was enunciated in the following language:

In the wars of the European powers in matters relating to themselves, we have never taken any part, nor does it comport with our policy to do so. It is only when our rights are invaded or seriously menaced that we resent injuries or make preparations for our defense. With the movements in this hemisphere we are of necessity more immediately connected, and by causes which must be obvious to all enlightened and impartial observers. The political system of the allied powers is essentially different in this respect from that of America. This difference proceeds from that which exists in their respective governments. And to the defense of our own, which has been achieved by the loss of so much blood and treasure and matured by the wisdom of their most enlightened citizens, and under which we have enjoyed unexampled felicity, this whole nation is devoted. We owe it, therefore, to candor and to the amicable relations existing between the United States and those powers to declare that we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered and shall not interfere. But with the governments who have declared their independence and maintained it, and whose independence we have, on great consideration and on just principles, acknowledged, we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power in any other light than as the manifestation of an unfriendly disposition toward the United States. . . . Our policy in regard to Europe, which was adopted at an early stage of the wars which have so long agitated that quarter of the globe, nevertheless

remains the same, which is not to interfere in the internal concerns of any of its powers; to remain the Government *de facto* as the legitimate Government for us; to cultivate friendly relations with it and to preserve those relations by a frank, firm, and manly policy, standing in all instances upon the just claims of every power, maintaining to justice their own. But in regard to those continents, continents are emphatically and unequivocally different. It is impossible that the allied powers should extend their political system to any portion of either continent without endangering our peace and happiness; nor can any one believe that our southern neighbors, if left to themselves, would adopt it of their own accord. It is equally impossible, therefore, that we should behold such interposition in any form with indifference.

The scope and limitations of the Monroe doctrine Mr. Olney defined as follows:

The rule in question has but a single purpose and object. It is that no European power or combination of European powers shall formally declare an American state of the right and power of self-government and of shaping for itself its own political institutions and destinies.

That it has been the accepted public law of the United States ever since its promulgation, he showed from the utterances of statesmen; from its approval by every Administration; from the declarations of Congress, as when the House, in 1864, condemned the monarchy in Mexico, and when the Senate, in 1886, disapproved the connection of any European power with a canal across the isthmus of Isthmus, and from the acts and declarations of the executive branch of the Government. He affirmed that it was the most influential factor in the emancipation of South America; it compelled the French to evacuate Mexico, led to the neutralization of any inter-oceanic canal across Central America and the exclusion of Great Britain from exercising any dominion over any part of Central America by the Clayton-Bulwer treaty, inhibited the transfer of Cuba by Spain to any other European power, and the proposed cession of Yucatan to Great Britain or Spain, and was influential in bringing about the final relinquishment of our supposed British protectorate over the Mosquito coast. In the spirit of this doctrine, President Grant, in his message of 1879, declared that existing dependencies, when the present relations of colonies cease, are to become independent powers; another development is the objection to the arbitration of American questions to European powers, which prompted the United States Government to refuse to participate jointly with Great Britain and France in the war between Chili and Peru; and on the ground, among others, that the Monroe doctrine and the prestige of the United States would be impaired Secretary Bayard strenuously resisted the enforcement of the Politeness claim against Haiti. Mr. Olney defined the facts and principles on which the doctrine rests; the intervening causes, which make any permanent political union between a European and an American state unnatural and imprudent; the ancient usage of Europe, with which American states have nothing to do; and the difference in moral interests, Europe being, with a single exception, governmental, while America "is devoted to the idea that every people has an inalienable right to self-government, and in the United States has

furnished to the world the most conspicuous and conclusive example and proof of the excellence of free institutions." If the forcible intrusion of European powers is to be deprecated and should be resisted, resistance must come from the United States, since it only has the adequate strength, and Mr. Olney declared that the safety and welfare of the United States are so concerned with the maintenance of the independence of every American state against any European power as to justify and require the interposition of the United States whenever that independence is endangered. He defined the position of the United States further:

To-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition. Why? It is not because of the pure friendship or good will felt for it. It is not simply by reason of its high character as a civilized state, nor because wisdom and justice and equity are the invariable characteristics of the dealings of the United States. It is because, in addition to all other grounds, its infinite resources, combined with its isolated position, render it master of the situation and practically invulnerable as against any or all other powers. All the advantages of this superiority are at once imperiled if the principle be admitted that European powers may convert American states into colonies or provinces of their own. The principle would be eagerly availed of, and every power doing so would immediately acquire a base of military operations against us.

He pictured the disastrous consequences that would befall the United States were the struggle now going on for the acquisition of Africa transferred to South America, when all South America might be partitioned among European powers, one of the least of which would be the loss of prestige, of authority, of weight among the councils of nations, for then "our only real rivals in peace as well as enemies in war would be located at our very doors"; then "we too must be armed to the teeth, we too must convert the flower of our male population into soldiers and sailors, and by withdrawing them from peaceful industry we too must practically annihilate a large share of the productive energy of the nation." He pointed out that if the political control at stake involves the command of the mouth of the Orinoco, it is of immense consequence in connection with the whole river navigation of the interior of South America. Should Great Britain insist that it, too, is a South American state, he argued that, if the boundary question can not be settled otherwise than by force, British Guiana, with her independent resources, should be left to settle it with Venezuela; but the proposition that a European power with an American dependency is, for the purposes of the Monroe doctrine, to be classed as an American state, he thought, did not admit of serious discussion, for then any European power having a South American colony, or any one that can procure a fraction of South American soil by voluntary cession, would be enabled to extend its possessions indefinitely. The declaration in the Monroe message that existing colonies or dependencies would not be interfered with meant "colonies or dependencies then existing, with their limits as then existing." Having made it clear that the United States may legitimately insist upon the merits of the

boundary question being determined, Secretary Olney declared that the only feasible mode of determining them is by peaceful arbitration, any conventional adjustment having been found impracticable, and an appeal to arms was not only condemnable as a relic of barbarism, but "so one-sided a contest could not be invited nor even accepted by Great Britain without distinct disparagement to her as a civilized state." Great Britain admits, he wrote, that there is a controversy and that arbitration should be resorted to for its adjustment; but the practical effect of this attitude is nullified by her insistence that, as a condition of arbitrating her right to a part of the disputed territory, the remainder shall be turned over to her, consisting of territory that has always and consistently been claimed by Venezuela. It is intimated that the claim of Great Britain to this particular territory rests upon an occupation which, whether acquiesced in or not, has ripened into a perfect title by long continuance; but, even if prescription affecting territorial rights can be said to exist between sovereign states, the legitimate consequence is "not that all arbitration should be denied, but only that the submission should embrace an additional topic, namely, the validity of the asserted prescriptive title either in point of law or in point of fact." The principle that a sovereign state can not be asked to arbitrate its political rights over its territory has no pertinency when the interests or the territorial area involved can not appreciably affect by their loss its honor or power, as Great Britain has shown by arbitrating the extent of her colonial possessions twice with the United States, once with Portugal, and once with Germany. The attitude assumed by Great Britain in refusing to arbitrate unless a part of the debatable land, designated by herself, is first abandoned to her, seemed to Mr. Olney to deprive Venezuela of her free agency and put her under virtual duress.

Lord Salisbury did not answer Mr. Olney until the points raised had been carefully considered by the law officers of the Crown. In the first of two notes, both dated Nov. 26, 1895, he dealt with the Monroe doctrine, which, he believed, had never before been advanced in a written communication addressed to another government, and which had undergone a notable development since 1823.

The formation of the Holy Alliance, the congress of Labach and Verona, the invasion of Spain by France for the purpose of forcing upon the Spanish people a form of government which seemed likely to disappear unless it was sustained by external aid, were incidents fresh in the mind of President Monroe when he penned his celebrated message. The system of which he speaks, and of which he so resolutely deprecates the application to the American continent, was the system then adopted by certain powerful states upon the Continent of Europe of combining to prevent by force of arms the adoption in other countries of political institutions which they disliked, and to uphold by external pressure those which they approved. Various portions of South America had recently declared their independence, and that independence had not been recognized by the governments of Spain and Portugal, to which, with small exception, the whole of Central and South America were nominally subject. It was not an imaginary danger that he foresaw if he feared that the same spirit which had dictated the French expedition

into Spain might inspire the more powerful governments of Europe with the idea of imposing, by the force of European arms, upon the South American communities the form of government and the political constitution which they had thrown off. In declaring that the United States would resist any such enterprise if it was contemplated President Monroe adopted a policy which revealed the entire sympathy of the English Government of that date.

Lord Salisbury found it intelligible that Mr. Olney should invoke "an authority which enjoys so high a popularity with his own fellow-countrymen," but the dangers apprehended by President Monroe "have no relation to the state of things in which we live at the present day." Great Britain is imposing no "system" upon Venezuela, but the British Empire and the republic of Venezuela "are neighbors having a controversy about boundaries with which the United States have no apparent concern," it being "simply the determination of the frontier of a British possession which belonged to the throne of England long before the republic of Venezuela came into existence." While denying the applicability of the Monroe doctrine to the Guiana dispute, and controverting the extension of it which invests the United States with the "novel prerogative" of demanding the submission of any frontier difference which a European power may have with a South American community to arbitration, he disclaimed any acceptance of the doctrine itself, a novel principle forming no part of international law, having never been recognized by the government of any other country. The right of the United States to interfere when their interests are affected he held to be in no way strengthened by the fact that the controversy affects American territory, and he protested against Mr. Olney's declaration that a permanent political union between a European and an American state is inexpedient and unnatural, the necessary meaning of which is that the union between Great Britain and Canada, Jamaica, Trinidad, British Honduras, or British Guiana is "inexpedient and unnatural." The British Government, he said in conclusion, was "not prepared to admit that the interests of the United States are necessarily concerned in every frontier dispute which may arise between any two of the states who possess dominion in the western hemisphere," and still less to accept the doctrine "that the United States are entitled to claim that the process of arbitration shall be applied to any demand for the surrender of territory."

In his second note Lord Salisbury said that Great Britain's title to the territory in dispute was derived by conquest from the Dutch; that Venezuela derived no title from Spain, because Spain had not asserted ownership of it, Venezuela's argument being based upon the principle "that, inasmuch as Spain was originally entitled of right to the whole of the American continent, any territory on that continent which she can not be shown to have acknowledged in positive and specific terms to have passed to another power can only have been acquired by wrongful usurpation, and, if situated to the north of the Amazon and west of the Atlantic, must necessarily belong to Venezuela as her self-constituted inheritor in those regions." The Schomburgk line he described as a great

reduction of the boundary claimed by Great Britain as matter of right, which has been laid from the first to comprise the coast line up to the river Amazon and the whole basin of the Essequibo river and its tributaries. A portion of this claim, said Lord Salisbury, the British authorities have always been willing to waive altogether; in regard to another portion they have been, and continue to be perfectly ready to submit the question of their title to arbitration; but "as regards the rest, that which lies within the so-called Schomburgk line, they do not consider that the rights of Great Britain are open to question." Sir R. Schomburgk, he said, "did not discover or invent any new boundaries. He took particular care to fortify himself with the history of the case. He had further from actual exploration and information obtained from the Indians, as at Point Barlow, and from local traditions, as on the Cuyuni, fixed the limits of the Dutch possessions and the sphere from which all Spanish influence was absent." Even within that line they have offered, he asserted, considerable concessions as a matter of friendship and conciliation, and if these concessions, as time has gone on, "diminished in extent and have now been withdrawn, this has been the necessary consequence of the gradual spread over the country of British settlements, which her Majesty's Government can not, in justice to the inhabitants, offer to surrender to foreign rule." In conclusion, he refused, in behalf of the British Government, "to submit to arbitration of another power or to foreign justice, however eminent, claims based upon the extravagant pretensions of Spanish officials of the last century and involving the transfer of large numbers of British subjects, who have for many years enjoyed the settled rule of a British colony, to a nation of different race and language, whose political system is subject to frequent disturbances, and whose institutions as yet too often afford very inadequate protection to life and property."

After the receipt of the British Government's refusal to arbitrate except in regard to territory west of the Schomburgk line and not yet claimed by the miners from Guiana, President Cleveland laid the matter before Congress, on Dec. 17, in the following message:

In my annual message addressed to the Congress on the 2d inst. I called attention to the pending boundary controversy between Great Britain and the republic of Venezuela, and invited the submission of a representation made by this Government to her Majesty's Government, suggesting reasons why such dispute should be submitted to arbitration for settlement, and inquiring whether it would be so submitted. The answer of the British Government, which was then received, has since been received, and, together with the dispatch by which it is conveyed, is herewith appended. Such reply is embodied in two communications addressed by the British Prime Minister to Sir Julian Pauncefote, the British ambassador at this capital. It will be seen that one of these communications is devoted exclusively to observations upon the Monroe doctrine, and shows that in the present instance a new and strong opposition and development of this doctrine is insisted on by the United States; that the reasons justifying an appeal to the doctrine contained by President Monroe are generally inapplicable "to the case of states in which we live at the present day," and especially in-

GALIBI, BRITISH COL. NEW GUYANA.

applicable to a controversy involving the boundary line between Great Britain and Venezuela.

Without attempting extended argument in reply to these positions, it may not be amiss to suggest that the doctrine upon which we stand is strong and sound because its enforcement is important to our peace and safety as a nation and is essential to the integrity of our free institutions and the tranquil maintenance of our distinctive form of government. It was intended to apply to every stage of our national life, and can not become obsolete while our republic endures. If the balance of power is justly a cause for jealous anxiety among the governments of the Old World and a subject for our absolute indifference, none the less is an observance of the Monroe doctrine of vital concern to our people and their Government.

Assuming, therefore, that we may properly insist upon this doctrine without regard to the state of things in which we live or any changed conditions here or elsewhere, it is not apparent why its application may not be invoked in the present controversy. If a European power, by an extension of its boundaries, takes possession of the territory of one of our neighboring republics against its will and in derogation of its rights, it is difficult to see why to that extent such European power does not thereby attempt to extend its system of government to that portion of this continent which is thus taken. This is the precise action which President Monroe declared to be "dangerous to our peace and safety," and it can make no difference whether the European system is extended by an advance of frontier or otherwise. It is also suggested in the British reply that we should not seek to apply the Monroe doctrine to the pending dispute because it does not embody any principle of international law which is "founded on the general consent of nations," and that "no statesman, however eminent, and no nation, however powerful, are competent to insert into the code of international law a novel principle which was never recognized before and which has not since been accepted by the Government of any other country." Practically, the principle for which we contend has peculiar if not exclusive relation to the United States. It may not have been admitted in so many words to the code of international law, but, since in international councils every nation is entitled to the rights belonging to it, if the enforcement of the Monroe doctrine is something, we may justly claim it has its place in the code of international law as certainly and as securely as if it were specifically mentioned; and when the United States is a suitor before the high tribunal that administers international law, the question to be determined is whether or not we present claims which the justice of that code of law can find to be right and valid. The Monroe doctrine finds its recognition in the principles of international law, which are based upon the theory that every nation shall have its rights protected and its just claims enforced. Of course, this Government is entirely confident that under the sanction of this doctrine we have clear rights and undoubted claims. Nor is this ignored in the British reply. The Prime Minister, while not admitting that the Monroe doctrine is applicable to present conditions, states that in declaring that the United States would resist any such enterprise if it were contemplated, President Monroe adopted a policy which received the entire sympathy of the English Government of that date. He further declares that though the language of President Monroe is directed to the attainment of objects which most Englishmen would agree to be salutary, it is impossible to admit that they have been inscribed by any adequate authority in the code of international law. Again, he says they (her Majesty's Government) fully concur with the view which President Monroe apparently entertained—that any disturbance of existing territorial distribution in that hemisphere by any fresh acquisitions on the part of any European state would be highly inexpedient.

In the belief that the doctrine for which we contend was clear and definite, that it was founded upon substantial considerations, and involved no policy and nothing, that it was fully applicable to the present conditions and to the state of the world's progress, and that it was already applied to the pending controversy, and without any compulsion as to the final merits of the dispute, but desiring to leave in a satisfactory and conclusive manner whether Great Britain sought, under a claim of boundary, to extend her possessions on this continent without right, or whether she merely sought possession of territory fully included within her lines of ownership, this Government proposed to the Government of Great Britain a resort to arbitration as a proper means of settling the question, to the end that the territorial boundary dispute between the two countries might be determined and put exact settling and settled in respect to the controversy might be made final. It will be seen from the correspondence herewith submitted that this proposition has been declined by the British Government upon grounds which in the circumstances seem to me to be far from satisfactory. It is deeply disappointing that such an appeal, extended by the most friendly feelings toward each nation directly concerned, addressed to the sense of justice and to the consciousness of one of the great powers of the world, and touching its relations to you comparatively weak and small, should have produced no better result.

The course to be pursued by this Government, in view of the present condition, does not appear to admit of serious doubt. Having seemed satisfied for many years to leave Great Britain to settle this dispute by impartial arbitration, and having been most finally apprised of her refusal to do so, setting aside the plain requirements, and to deal with it accordingly, Great Britain's present proposition has never been so far from regarded as abandoned by Venezuela, though any adjustment of boundary which that country may claim for her advantage and may even run of her own free will run not, of course, be claimed to by us. Assuming, however, that the attitude of Venezuela will remain unchanged, the dispute has reached such a stage as to make it now incumbent upon the United States to take measures to determine with sufficient certainty for its justification what is the true divisional line between the republic of Venezuela and British Guiana. An inquiry to that end, and, of course, to be conducted carefully and impartially, and due weight should be given to all available evidence, records, and facts in support of the claims of both parties. In order that such examination should be proceeded in a thorough and satisfactory manner, I suggest that Congress make an adequate appropriation for the expenses of a commission, to be appointed by the Executive, who shall make the necessary investigation and report upon the matter with the least possible delay. When such report is made and accepted it will, in my opinion, be the duty of the United States to stand by every point in its behalf, as a valid aggression upon its rights and interests, and the appropriation by Great Britain of any lands or the extension of governmental jurisdiction over any territory which, after investigation, we have demonstrated to belong to Venezuela.

In making these recommendations I am fully alive to the full responsibility incurred and heavily borne all the consequences that may follow. I am very fully alive, in my conviction, that, while it is a grievous thing to condemn the two great English-speaking peoples of the world as being otherwise than friendly competitors in the onward march of civilization and science and worthy rivals in all the arts of peace, there is no realizing what a great nation can be in which people that which follows no principle submission to wrong and injustice and a consequent loss of national self-respect and honor, honor which is attacked and defended the people's safety and greatness.

The Congress having unanimously authorized the appointment of commissioners to report upon the true divisional line between British Guiana and Venezuela, the President appointed a commission composed as follows: Justice David J. Brewer, of the United States Supreme Court; Chief-Justice Alvey, of the Court of Appeals of the District of Columbia; Andrew D. White, of New York; Frederick R. Coudert, of New York; and Daniel C. Gilman, President of Johns Hopkins University, Baltimore.

VERMONT, a New England State, admitted to the Union March 4, 1791; area, 9,565 square miles. The population, according to each decennial census since admission, was 154,465 in 1800; 217,805 in 1810; 235,966 in 1820; 280,652 in 1830; 281,948 in 1840; 314,120 in 1850; 315,095 in 1860; 350,551 in 1870; 332,286 in 1880; and 332,422 in 1890. Capital, Montpelier.

Government.—The following were the State officers during the year: Governor, Urban A. Woodbury; Lieutenant Governor, Zophar M. Mansur; Secretary of State and Insurance Commissioner, Chauncey W. Brownell, Jr.; Treasurer, Henry F. Field; Auditor, Franklin D. Hale; Adjutant General, T. S. Peck; Superintendent of Education, Mason S. Stone; Bank Inspector, Frederick E. Smith; Railroad Commissioners, Olin Merrill, Orion M. Barber, Charles J. Bell; Chief Justice of the Supreme Court, Jonathan Ross; Associate Justices, John W. Rowell, Russell S. Taft, Henry R. Start, L. H. Thompson, James M. Tyler, Loveland Munson—all Republicans.

Finances.—The total State expenses for the year ending June 30, 1895, were \$633,863.67. The cost of the Legislature of 1894 was \$58,815.04. The payments into the treasury by towns of all profits upon the sales of liquors in excess of 10 per cent., according to the law of 1894, amounted to only \$544.36, many towns having reduced the selling prices. The estimate of the income for the year 1895-'96 from State and corporation taxes place it at \$520,000.

Education.—The number of public schools in the State is 2,292; the aggregate cost in 1882 was \$476,478.08; in 1892 it had risen to \$735,480.18, and in 1894 to \$783,805.40. Of this amount, \$561,809.89 was paid to teachers in 1894. The number of children in parochial schools is 3,118. In 1892 it was 4,305. The expenditure *per capita* of population in 1890-'91 was \$2.18. The total valuation of school property is \$1,022,086.95.

Charities.—Preparations for the completion of the insane asylum at Waterbury were finished early in the year, and the contract was let. The State has bought a farm of 60 acres adjoining the asylum property for \$7,000. The cost of finishing the buildings will be about \$90,000.

The report of the Soldiers' Home, at Bennington, shows that the number cared for during the year was 127; the number of inmates June 30, 1895, was 104. Four had died, and 18 were in hospital. The receipts for the year ending June 30, 1895, including \$2,065.65 cash on hand at the beginning of the fiscal year, were \$18,518.21. The amount on hand was \$800.64, from which it appears that the current expenses and ordinary repairs amounted to \$17,317.57. The cost *per capita* was \$228.08.

Insurance.—Fire insurance companies have long maintained that their losses incurred in Vermont and the expense of doing the business largely exceed the premiums. In 1894 the premiums amounted to \$763,429.77; the losses incurred were \$716,571.27, or about 94 per cent. of the premiums. Individual instances are given of losses largely exceeding premiums, and, in the case of 20 of the 45 companies doing business in the State, the losses exceed the premiums in varying amounts.

The report of the National Life Insurance Company of Vermont, which has been in business for forty-five years, shows that the net assets aggregated at the beginning of the year \$10,205,635.60. It had received during the year \$2,931,322.50. It had paid in death claims \$476,758.23; in matured endowments and surrendered policies, \$607,669.28; in surplus returned, \$122,179.81; aggregating \$1,206,607.32 returned to policyholders. The total expenses had been \$651,171.63. Interest due and accrued, unreported and deferred premiums, and premium on stocks and bonds aggregated \$840,041.11, making the gross assets \$11,045,676.71. The total liabilities as to policyholders, including computed reserve (actuaries' 4 per cent.), \$9,216,926.10, and extra reserve of life-rate endowments, \$354,216.54, were \$9,614,962.69, leaving a surplus (4 per cent.) of \$1,430,714.02, or, computed at 4½ per cent., of \$2,075,898.85. It has now in force 30,186 policies, insuring \$64,975,950. In new business the following is the record for 1894: Policies issued and revived, 6,813, insuring \$14,769,916; increase in gross ledger assets, \$1,158,824.70; increase in surplus, \$296,621.66; increase in interest received, \$55,932.88. The gain during the year of the number of policies in force is 1,842; in insurance in force, \$3,343,337; in receipts from premiums, \$83,887.32. The payment for death claims was \$57,931.19 less than in 1893, but payments to policyholders \$117,963.15 more.

Industries and Products.—The report of Victor I. Spear, Secretary of the Board of Agriculture, shows that \$1,142,650 was invested during 1894 in new manufacturing enterprises and that employment is given by them to 1,367 persons. The amount of new capital invested is nearly three times the amount for 1893, with more than double the number of employees. During the four years just past \$3,108,960 in capital was invested, giving employment to 5,264 persons. The largest two industries undertaken were the cotton mill at Burlington and the furniture factory at Canaan, the former with a capital of \$400,000, and the latter with \$250,000.

The number of farms sold in 1894 was 1,973, of which 155 were unoccupied. The total sales of this class of farms in five years were 909.

There were 650 hotels, boarding houses, and private dwellings open for guests during the summer.

At the beginning of the year there were 190 dairy factories in the State, receiving milk from about 100,000 cows, and several were established during the year. The largest is at St. Albans, where 11 tons of butter were made in a single day in 1895.

Vermont is interested in the sugar bounty, as

one third of the entire crop of maple sugar in the country is made there. The bounty for 1894 amounted to \$81,270.00.

New marble quarries have been opened in Washington and Barre.

New Cities.—Montpelier and Barre received charters from the Legislature of 1894. The census of Montpelier, finished in the summer, shows a total population of 5,045. The increase since 1880 is 1,808; since 1890 it is 900. The indebtedness of the city is \$128,871.33. Montpelier has a new free library, finished in 1893, called the Kellogg-Hubbard Library, from the names of the donors. The Montpelier Public Library received an offer from Thomas W. Wood, President of the Academy of Design in New York, a native of the city, to establish as a part of the library "an attractive collection of oil paintings, water colors, and etchings, for the benefit of students who may wish to copy these works of art, as well as for the gratification and education of the public," provided the library should be removed to the building of the Young Men's Christian Association. The gift was accepted, and the gallery was opened formally in August. The collection contains 24 oil paintings, 11 etchings, and 7 water colors. The two latter exhibits are original works of the donor in conception and execution; but of the oil paintings, there are 14 copies from the works of famous men. Another gift to the capital city is a cottage hospital, which was in process of erection during the year at a cost of \$20,000 to \$25,000; it is the gift of a citizen, Homer W. Heaton.

Revision of the Statutes.—The statutes as revised by the committee and accepted by the Legislature of 1894, which gave the copy to the printers in July, went into effect Aug. 1.

State Boundary.—The Boundary-line Commission of the States of Vermont, New Hampshire, and Massachusetts finished its work in the summer. The meeting point of the three States was fixed on the west bank of Connecticut river, just east of the South Vernon Railroad station, at about low-water mark. A monument of rubble masonry will be put deep in the soil, reaching to the surface; then a properly inscribed marker of granite is to be erected, referring to the actual corner. About 60 monuments are to be erected between Vermont and Massachusetts. The line as defined between Vermont and Massachusetts runs through the ladies' room of the railroad station at South Vernon.

Bennington-battle Day.—The last Legislature made a law providing that Aug. 16 shall be a legal holiday, to be known as Bennington-battle Day, and it was so observed this year. The report of the Bennington Battle Monument Association shows that the receipts from visitors are more than sufficient to pay expenses.

Legislative Reunion.—A reunion of present and past members of the Legislature was held at Montpelier, Oct. 2 and 3. It was estimated that there were 3,000 or more ex-members living—many in other States—and invitations were sent to all. Hon. W. P. Dillingham was chosen president of the Reunion Association. There was a procession in the morning of Oct. 2, with about 800 in line, and a session of the Sen-

ate in the afternoon, at which the Lieutenant Governor presided. In the evening the Governor and ex-governors held a reception in the executive chamber. In the afternoon of Thursday, the second day, a session of members and ex-members of the House was held, after an historical address by ex-Gov. Stewart. The evening was given to a banquet. A similar session, the first of its kind, was held in October, 1903.

VIRGINIA. a Southern State, one of the original thirteen, ratified the Constitution June 25, 1789; area, 42,450 square miles. The population, according to each decennial census, was 747,610 in 1790; 880,000 in 1800; 954,000 in 1810; 1,065,116 in 1820; 1,211,605 in 1830; 1,329,797 in 1840; 1,411,861 in 1850; 1,506,718 in 1860; 1,223,164 in 1870; 1,513,545 in 1880; and 1,655,990 in 1890. Capital, Richmond.

Government.—The following were the State officers during 1893: Governor, Charles T. O'Ferrall, Democrat; Lieutenant Governor, Robert C. Kent; Secretary of the Commonwealth, James T. Lawless; Attorney General, R. Taylor Scott; First Auditor, Morton Myers; Second Auditor, Josiah Ryland, Jr.; Treasurer, A. W. Harman; Adjutant General, Charles J. Anderson; Superintendent of Public Instruction, John E. Massey; Commissioner of Agriculture, Thomas Whitehead; President of the Court of Appeals, James Keith; Justice, John W. Rely, John A. Buchanan, George M. Harrison, and Richard H. Carlwell.

Finances.—The report of the Auditor for the year ending Sept. 30, 1893, showed the following figures: Amount on hand Oct. 1, 1892, \$131,245.99; receipts from all sources during the year, \$3,321,307.37; total, \$3,452,553.36; disbursements during the year, \$1,894,197.37; balance on hand Oct. 1, 1893, \$1,558,355.99. Among the receipts were \$903,450.17 from license; \$308,119.91 from personal property; \$1,000,000.00 from real estate; \$211,329.28 from railroads; \$150,850.58 from tax on law practice; and \$34,981.88 from insurance companies; and among the disbursements were \$170,331.33 for interest on the public debt and bonds loaned by educational institutions; \$227,903.87 for the support and care of inmates; \$302,601.09 for account of criminal charges; \$347,434.39 for the support of public education; \$118,491.58 for account of the State Penitentiary; and \$113,102.96 for expenses connected with the erection of the library building.

The Second Auditor reported for the year ending Sept. 30, 1893, concerning the State debt: Amount of bonds and certificates (5 per cent), issued under acts of Feb. 14, 1892, and Nov. 28, 1894, \$3,280,087.17; amount canceled, \$895,704.01; amount held by the commissioners of the sinking fund and canceled, \$1,237,328.00; of leaving amount outstanding \$9,358,295.16, of which \$1,439,372.26 was held by the library fund and \$4,000,000.00 by the public. The amount of bonds and certificates issued under the act of Feb. 28, 1892, and its amendment of Jan. 21, 1894 (5 per cent), was \$1,007,200.00; canceled, \$1,201; leaving \$1,005,998.99, of which the sinking and library funds held \$895,900, and the public \$170,098.99. The amount of bonds and certificates outstanding Oct. 1, 1893, issued under acts prior to Feb. 14, 1892 (5 per

unfunded bonds reduced one third for West Virginia's portion), was \$1,028,217.74; amount of interest outstanding due to July 1, 1891, \$1,624,252.67; total, \$2,652,470.41. There was held by the United States Government, in trust for certain Indian tribes, bonds of the State of Virginia, which, with interest to July 1, 1891, amounted to \$1,495,678, two thirds of which, deducted from the preceding amount of \$2,652,470.71, leaves \$1,655,351.74. The Literary fund held a total in bonds and a loan of \$1,464,227.28.

Valuations.—Under the reassessment of 1895 the total value of land, town lots, and buildings was fixed at \$189,571,619 in the counties and \$112,496,521 in the cities, an aggregate of \$302,068,140. The land books of 1895 fixed this total at \$313,182,340, of which \$302,753,610 was charged against white persons and \$10,428,730 against colored. The total assessed valuation of personal property was \$83,132,476, of which \$79,958,026 was charged against white persons and \$3,174,450 against colored persons. Of the aggregate tax assessed (\$1,983,042.30) the amount against white persons was \$1,808,234.21, and against colored persons \$174,808.09.

Banks.—On Oct. 31, 1895, there were 37 national banks in operation and 16 in liquidation. The active banks had a combined capital of \$4,796,300; United States bonds on deposit, \$2,096,750; outstanding circulation, \$1,992,339; excess of United States bonds over the amount required, \$1,061,500; loans and discounts, \$15,677,095; coin and coin certificates, \$859,623.40; deposits, \$13,829,545; reserve required, \$2,074,432; and reserve held, \$3,314,248. The State banks on July 11, 1895, numbered 85, and had an aggregate capital of \$6,503,896; loans and discounts, \$17,898,196; resources, \$25,040,095; deposits, \$14,604,673; and surplus and undivided profits, \$2,520,908. The State banks held a total of \$1,493,658 in specie, paper currency, and unclassified cash. The aggregate banking capital of the State was \$11,300,196.

Education.—The school census of 1895 showed that there were in the State 665,533 children of school age, of whom 397,030 were white and 268,503 colored. The enrollment in the public schools was 235,533 white children and 120,453 colored—total, 355,986; and the average daily attendance was 137,830 whites and 64,700 colored—total, 202,530. There were 8,278 public schools in operation, 6,035 for white children and 2,243 for colored. The teachers numbered 8,292, of whom 6,211 were white, 2,081 colored, 3,039 males, and 5,253 females. The estimated value of school property owned by districts was \$2,982,828.98; revenue of the school system, \$1,824,287.77; and expenditures for current expenses, \$1,622,392.94; for permanent improvements, \$185,199.46; total, \$1,807,592.40. At the close of the school year 1894 there were 9 universities and colleges of liberal arts, with a total of 152 professors and instructors and 1,971 students in all departments, of whom 1,763 were males and 208 females. These institutions had 141,650 volumes in their libraries, \$403,200 invested in scientific apparatus and libraries, \$2,123,000 in grounds and buildings, and \$1,867,982 in productive funds, and received from tuition fees \$94,175, from productive funds \$99,823, and from Federal, State, and other ap-

propriations \$40,000—total income, \$297,775; and benefactions, \$22,565. The public high schools numbered 31, and had 89 instructors and 1,867 pupils; the endowed academies, seminaries, and other private secondary schools, 53, with 148 instructors, 2,225 pupils in secondary grades, of whom 98 were colored, and 24,000 volumes in the libraries; and the colleges exclusively for women, 14, with 176 instructors, 1,869 students in all departments, and 9,260 volumes in the libraries. There were 2 public normal schools, with 21 instructors and 274 students in the normal course and 269 in the nonprofessional course; and 2 private normal schools, Hampton Normal and Agricultural Institute and Hartshorn Memorial College, with 87 instructors and 386 students in the normal course and 423 in the nonprofessional course. Commercial and business colleges numbered 4, and had 13 instructors and 542 students in day classes and 80 in evening classes. The financial report of the Virginia Agricultural and Mechanical College for the school year 1894-'95 showed: Receipts from the State, \$18,500; from the United States Government, under the act of Congress of 1862, \$20,569; under the act of 1890, \$13,333, and for support of experiment station, \$15,000; and from fees and all other sources, \$15,509—total, \$82,911; and expenditures for the college proper, \$66,036; for the experiment station, \$20,594—total, \$86,630. The Hampton Normal and Agricultural Institute for colored students and Indians had receipts in the same period of \$10,329 from the United States Government under the act of 1862, and \$6,668 under that of 1890, and \$121,848 from fees and all other sources—total, with balance of \$6,168 from 1894, \$145,013; and expenditures for all departments, \$128,852.

The main building of the University of Virginia, at Charlottesville, was destroyed by fire on Oct. 27. The institution had 46 professors and instructors, 567 students, 53,000 volumes in its library, \$274,600 invested in productive funds, income of \$136,000, and benefactions \$55,000. The calamity aroused the friends of the university everywhere and elicited prompt and liberal means for rebuilding and refurnishing.

Mineral Resources.—According to the report of the United States Geological Survey on "Mineral Resources of the United States in 1894," issued in 1895, Virginia's production of coal aggregated 1,229,083 short tons valued at \$933,576, an increase of 408,744 tons in quantity and \$240,828 in value over the output of the previous year. The number of persons employed in the mines was 1,635, and the number of days worked in the year two hundred and thirty-four. Because of its exemption from the miners' strike, the Pocahontas field increased its output nearly 50 per cent. over that of the preceding year, or from 779,590 short tons to 1,158,437. Of the total product of the State, 1,015,713 short tons were loaded at the mines for shipment, 21,162 were sold to local trade or used by employees, 4,690 were used at the mines for steam and heat, and 187,518 were burned into coke. Two coking plants had 736 ovens completed and 100 building, used 280,524 short tons of coal, and had an output of 180,091 short tons of coke, valued at \$295,747. The State ranked fourth in the

production of iron ore. For the purpose of not revealing individual operations Virginia and West Virginia were grouped, but little of the iron ore came from the latter State, and the output may be practically credited to Virginia. The aggregate production was 35,843 long tons of red hematite, 562,493 of brown hematite, and 2,226 of magnetite—total, 600,562 long tons; value, \$873,305. Twenty-two out of 30 furnaces were in blast during the year, and the production of pig iron was 298,086 long tons; production in the first half of 1895, 142,580 long tons. The output of manganese was 1,797 long tons; value, \$16,658. Quarry operations yielded granite to the value of \$123,361, principally in Chesterfield, Amherst, Henrico, Alexandria, Campbell, and Dinwiddie Counties; slate, \$188,151, chiefly in Buckingham County, with some in Amherst and Albemarle Counties; and limestone, \$284,547, mostly in Botetourt, Warren, Alleghany, and Shenandoah Counties. There were 104 clay-working plants, which had outputs valued as follow: Common and pressed brick, \$779,285; fancy and ornamental brick, \$76,474; fire brick, \$4,794; vitrified paving brick, \$52,750; drain tile, \$10,705; tile other than drain, \$6,696; and miscellaneous, \$6,880; total, \$937,593. The State ranked first in the number of mineral springs, of which 30 out of 84 reported an output for commercial sale of 402,827 gallons; value, \$80,715.

Taxable Manufactures.—The collections of internal revenue in the fiscal year ending June 30, 1895, amounted to \$2,607,181.90, an increase of \$59,258.55 over those of the previous fiscal year. There were 241 single-account tobacco factories, which used 1,289,050 pounds of tobacco for cigars and 3,362,282 pounds for cigarettes, and had an output of 86,752,368 cigars and 822,654,500 cigarettes; and 134 other tobacco factories, which used 41,235,067 pounds of leaf, 570,954 pounds of scraps, 1,505 pounds of stems, 2,610,110 pounds of licorice, 1,885,094 pounds of sugar, and 1,861,712 pounds of other materials, and had an output of 31,402,678 pounds of plug tobacco, 4,151,187 pounds of smoking tobacco, and 725,500 pounds of snuff. Out of 322 registered grain, molasses, and fruit distilleries, 102 grain and 149 fruit were in operation. The production of fruit brandy was 4,160 gallons; fermented liquors, 76,617 barrels; amount of spirits rectified, 708,165 gallons; and amount of distilled spirits gauged, 1,632,986 taxable gallons.

Agriculture.—The United States Department of Agriculture reported as follows on the principal crops of Virginia in the calendar year 1895: Corn, 1,753,073 acres, 32,607,138 bushels, value \$12,064,648; wheat, 699,725 acres, 6,505,583 bushels, value \$4,228,629; oats, 449,043 acres, 8,125,061 bushels, value \$2,437,518; rye, 45,141 acres, 496,551 bushels, value \$238,297; potatoes, 41,525 acres, 3,031,323 bushels, value \$1,151,904; and hay, 655,488 acres, 774,001 tons, value \$8,853,689; total value, \$28,994,305. The same authority reported in 1895 on the tobacco crop of the calendar year 1894 as follows: Acreage, 54,592; yield, 35,593,984 pounds; value \$2,135,639. Cotton planting was confined to about 12 counties in the southeastern portion of the State, and the acreage was controlled largely

by the comparative prices of cotton and peanuts, as both crops are grown in the same section, and a preference is given to the one bringing the best price.

Live Stock.—The estimates on the number and value of domestic animals on farms, Jan. 31, 1895, were as follow: Horses, 240,040, value \$9,809,259; mules, 36,238, value \$2,124,122; milch cows, 265,625, value \$4,818,419; sows and other cattle, 368,975, value \$4,139,886; sheep, 426,899, value \$964,760; and swine, 360,145, value \$3,769,511; total value, \$27,865,121.

Fisheries.—The Commissioner of Fisheries reporting for the year ending Dec. 31, 1895, stated that the attention of the commission had been directed almost wholly to the propagation of Spanish mackerel, and that 4,269,000 fry had been liberated from the hatchery on Chesapeake Bay. Excepting shad, the catch of which is constantly increasing, all the finer varieties of fish are becoming less abundant. The United States Commissioner estimated that the yield of the shore fisheries of Virginia, exclusive of shell-fish, crustaceans, and reptilian fisheries, amounts annually to \$661,000. The oystering industry on the East Shore amounts annually to \$40,000. The commissioner gave Virginia second rank among the States in the oyster industry, following Connecticut and preceding Maryland. He declared that the State owns 300,000 acres of natural oyster beds of an actual and immense money value and 400,000 acres of planting ground, and that the planting industry has yielded nearly one-half of the oyster revenue collected by the State, in spite of legislation that has cramped and circumvented its development. He was convinced that with businesslike legislation, Virginia would soon become the foremost oyster-producing State in the Union.

Political.—The General Assembly met in regular biennial session and organized on Dec. 4, 1895, by electing Senator Lawrence presiding pro tem, of the Senate, and John F. Ryan Speaker of the House. In his annual message, Gov. O'Ferrall called attention to the proposed constitutional convention, and discussed the principal reasons that had been urged in its favor; that the expenses of the State government could be diminished by returning to the old system of county courts, reducing the number of circuit judges and superintendents of public schools, abolishing the office of county treasurer, and imposing the duties now performed by him on the sheriff, and changing existing criminal laws in many particulars. The State treasury had been able to meet promptly every demand made on it, and scarcely at any period in its history have the finances of the State been in better condition. He regarded the public debt as having been settled on a basis honorable to the State and satisfactory to its creditors, and he could conceive of no condition of affairs that could arise to cause any commotion over it. Concerning the Walker election law, he expressed the belief that so far its efforts would meet with the hearty support of every citizen who values orderly elections, maintains the use of money at the polls, and desires a free, untrammelled, and unobscured expression of the will of the people. The Governor denounced lynching severely, and recommended the prompt

enactment of laws that would put an end to it. He also recommended the amendment of the Code, so as to conform to enlightened public sentiment, making prize fighting a felony, and a glove contest, whether in public or private or for any consideration whatever, also a felony. The act of 1894 against gambling on horse races had not had the beneficial result expected, and the Governor recommended that the act be amended by striking out the exception in favor of agricultural associations or fairs and driving clubs or parks, urging that the selling of books or making of pools or mutuels should be absolutely prohibited.

Among the legislative bills approved were

those to amend the act to provide for the settlement of the public debt of the State, not funded under the act to ascertain Virginia's debt at the time of the portion of her territory; to make the rector and visitors of the University of Virginia to repair the loss sustained by the fire there; to amend sections of the Code in relation to the proceedings against delinquent treasurers and their sureties; to authorize a vote in the city of Danville and town of Neapolis on the question of uniting the city and town in one city; to give a defendant in any case of misdemeanor the right to waive trial by jury; and to amend an act in reference to property that may be distrained for taxes.

W

WASHINGTON, a Pacific coast State, admitted to the Union Nov. 11, 1889; area, 69,180 square miles; population, according to the census of 1890, 349,300; estimated in 1894 at 410,000. Capital, Olympia.

Government.—The State officers for the year were: Governor, John H. McGraw, Republican; Lieutenant Governor, Frank H. Luce; Secretary of State, James H. Price; Treasurer, Ozro A. Bowen; Auditor, J. E. Frost, succeeding L. R. Grimes, deceased; Attorney-General, William C. Jones; Superintendent of Public Instruction, Charles W. Bean; Land Commissioner, William T. Forrest; Acting Adjutant General, E. C. MacDonald; State Printer, Oliver C. White; Secretary of the Board of Health, Dr. George S. Armstrong; State Librarian, G. A. Kennedy, succeeding F. T. Gilbert, deceased; Chief Justice, R. O. Dunbar; Associates, T. C. Stiles, John P. Hoyt, T. J. Anders; Superior Judge, Mason Irwin; United States Senator, John L. Wilson.

Finances.—The Treasurer's report for December shows a total cash balance of \$213,517.28. The total value of real and personal property in the State in 1895, as equalized by the State Board in October, was \$204,190,377. The increase on railroad property was \$54,014; on personal property, \$7,193. Real property was lowered \$43,790. The levy in Seattle was 12-5 in the old limits and 9-4 in the new. In King County the amount was \$42,260,615, and in Pierce \$34,499,410.

Legislative Session.—The fourth assembly of the legislative body was convened on the first Monday in January, and adjourned March 20. It passed 178 bills, only 2 of which were vetoed. One enactment abolishes prize fighting; the killing of singing birds is made punishable by a fine of not less than \$50 or more than \$100. Obstruction of railways brings imprisonment for twenty years; when life is lost by such obstruction it is considered murder. The people are to be permitted to plant oysters, and hold as personal property and be protected in tide and shore lands pending sale, lease, or reservation of such lands by the State. The anniversary of Abraham Lincoln's birth, Feb. 12, is made a holiday. The powers of State boards were in some particulars increased and new boards were created. The Stock Board is to guard against false entries, and to use stringent measures regarding the

care of stock. The Dairy Commissioners shall impose analysis upon State chemists and guard against adulteration. The Horticultural Board is given full power to attempt keeping pests in check, and liberal appropriations are made. A Grain Commission was also appointed. The new Adjutant General is an officer of the regular United States service. Other measures that became laws were as follow:

To provide for diking districts.

To compel street railway companies to require not more than ten hours' labor in twenty-four.

To punish deception in the sale of nursery stock.

Relating to the descent of real estate of deceased persons.

Creating a professor of veterinary science, to be added to the regular Health Board.

To amend the act for the preservation of large game.

To provide for State grain weighing and grading.

To grant title to land conveyed to aliens prior to the adoption of the State Constitution.

To provide for creating drainage districts.

For the relief of innocent applicants for the purchase of tide lands.

To prevent destruction of game on certain islands.

For the protection of Eastern oysters.

For the protection of trout.

Exempting the proceeds of life insurance from liability for debt.

To prohibit minors entering saloons.

To amend the act relating to the purchase of jute and other fabrics.

To amend the act relating to the organization of corporations.

Relating to trade-marks.

To establish the legal rate of interest in the State at 8 per cent. The contract rate may be as high as 12 per cent.

To punish fraud in the sale of stock.

Authorizing the establishment of public libraries in cities.

Establishing a fiscal agency in New York.

To prevent the spread of contagious diseases among cattle.

State Lands.—The Land Office business shows an increase of immigration. For the month of July, at the Olympia Land Office, the total number of acres sold was 4,134.34, for which \$6,267.05 was received. There were 8 homestead entries, comprising 783.54 acres; 58 final proofs, covering 8,397.37 acres; 6 timber-land entries; and 1 military land location.

Harbor Improvements.—The harbor at Olympia has been deepened to 12 feet. The ap-

appropriation was exhausted by March 1. The report of the engineer, Capt. T. W. Symonds, in charge of the improvements says:

The water way connecting Puget Sound with lakes Union and Washington contemplates the construction of a ship canal to connect the waters of the lakes with Puget Sound. A preliminary survey was made under the appropriation of 1890, and the work of last season was devoted to a verification of the surveys and to preparation for securing the right of way. This work is still in progress. The procurement of right of way is a work of considerable magnitude and expense.

The river and harbor appropriation passed in December included additional appropriation for Hoquiam.

State Capitol.—The foundation of the Capitol was completed June 13. The Capitol Commission resolved, in December, to issue the Capitol warrants in one block, and the legality of their act was laid before the Supreme Court, which sustained them in their intentions as proposed, and as firms were found ready to pay cash for them at par, the letting of the contracts was assured, and the next session of the Legislature is to be held in the new building.

State Institutions.—The State has property of great value, as follows:

Penitentiary at Walla Walla, farm and grounds, just mill, brickyard, buildings, and other improvements, \$504,243.09.

Western Washington Hospital for the Insane, at Fort Steilacoom, lands, buildings, furniture, etc., \$228,154.44.

Eastern Washington Hospital for Insane, Medical Lake, buildings, lands, live stock, water plant, and furniture, \$237,556.

State University, Seattle, old and new sites, old and new buildings, library, laboratory, etc., \$731,000.

Agricultural College, Pullman, buildings, farm and campus, equipment, sewer system, \$1,000.

School for Defective Youth and Feeble-minded Children, Vancouver, buildings and grounds and furniture, \$134,000.

Reform School, Chehalis, buildings and improvements, furniture and stock, land, \$67,000.

Soldiers' Home, Orting, land, buildings, water plant, etc., \$63,153.37.

Normal School, Ellensburg, buildings and grounds, equipment and furniture, \$71,000.

Normal School, Cheney, site and grounds, equipments and furniture, \$14,000.

State Fair, North Yakima, 120 acres, race track, stalls, etc., \$47,000.

Capitol, buildings and grounds, \$150,000.

The total value of these institutions is \$2,453,908.30.

Education.—The State Superintendent of Public Schools apportioned in September to the various counties their shares of \$20,252.85, to be used for school purposes. King County received \$4,360.70, and Franklin \$34.30. The total school census figures were 119,347.

The State University has recently been placed in position to make rapid progress. In addition to its generous endowment of public lands, including a site of 320 acres in Seattle and new buildings, it has received an equipment of the best and latest new apparatus. It opened on Sept. 3 with 500 students. Dr. Mark W. Harrington, late chief of the Weather Bureau at Washington and Professor of Astronomy of the University of Michigan, is the newly elected president.

The Normal School, at Cheney, received an ap-

propriation of \$80,000 for a new building. The school at Whatcombs received \$40,000. The Legislature passed the bill forbidding vivisection in the public schools, and also to enforce strict teaching of the duty and obligation of showing care and kindness to animals.

Timber.—The output of the Tacoma mills for 1895 was about 115,000,000 feet.

Forest fires did great injury during the year. These fires were serious in the vicinity of Blackton and Mount Vernon, in Whatcombs County, at Skagit, Montesano, Okanogan, Samish, Elma, Nelson, and Waukena, and at some points made mining dangerous.

Mining.—Coal was discovered at Gary City in June in quantities sufficient to prove important to Olympia and Gray's Harbor. The survey in July of the mines in Lewis County found 187 acres on the northeast side of the mine and 452 acres on the southwest side of the mine. The whole thickness of the vein is 45 feet. Geologists estimate that 14 different veins of 112 feet of coal lie under the land as surveyed. Railway surveys have been made for roads to this section from Tacoma and Olympia.

Fisheries.—During September and October the shipments of oysters, clams, fish, and mussels from Olympia Harbor equalled the shipments of eight months of 1894. The total number of pounds for those two months was 18,472. An appropriation of \$20,000 was made to establish fish hatcheries on the Columbia.

Mount Tacoma.—The party who climbed Mount Tacoma in December, 1894, returned in January, 1895, reporting no actual change in the contour of the crater. It is elliptical, with major and minor axes of 1,330 and 1,260 feet. The supposed eruption was due to the falling of pillars of ice under the snow, and the apparent smoke was steam. A party of heliographists set out to ascend the mountain June 10, 1892. The smoke from forest fires was so thick that the signals arranged between Mount Tacoma and Mount Adams were not discernible. Only 3 other people had ever reached the summit of the North peak at as high an altitude as this party accomplished. They found it 100 feet lower than last year. The heliographists slept in the crater for ten days.

WEST AFRICA. European powers previous to 1892 had only a few trading stations on the western coast of Africa between the river Drava, forming the southern boundary of Senegal, and the mouth of the Congo. Since then the whole coast except Liberia and vast territories in the interior have been acquired by military occupation or divided among the powers by mutual agreement. The French have claimed sovereign rights in Senegal, and the English have had stations in Gambia and Lagos since the middle of the seventeenth century. The colony of Sierra Leone was peopled by freed negro slaves from the British West Indies. The French settlements on the Gulf of Guinea were first re-established in 1843, and in 1892 the occupation of the highest reaches of the great Ogive was begun, with a view of establishing a trade route to the upper Congo region. In 1894 Germany, which had previously no African possessions, occupied Togoland and the Cameroons. That and the founding of the Congo Free State

spurred England and France to extend their possessions, and the rivalry between the three powers that began with exploring expeditions and the securing of treaties from the native chiefs took the form of military conquests when the doctrine of effective occupation was adopted in African international law. The powers were compelled to agree upon conventional boundaries not only for their possessions on the coast, but for their spheres of interest, because Algeria and the Congo State were not delimited, the coasts faced west, south, and southwest, causing the *Hinterlands* to overlap, and 2 powers were established on the Niger, and 2 also on the Congo. The northern boundary of the Congo State was defined in a convention first made between the International Association of the Congo and Germany, on Nov. 8, 1884, and signed by France and Portugal in February, 1885. The British Royal Niger Company, first organized in 1882, obtained in 1884-'86 about 300 treaties from native chiefs, covering Borgu and Sokoto, and the whole basin of the middle Niger and the Benue, thus defeating German hopes of trade and colonization and endeavoring to thwart French expansion in the Soudan. The company obtained a royal charter on July 10, 1886. By an agreement made with Germany by the British Government in August, 1886, the line between the sphere of the Niger Company and Cameroons was to be drawn from a point on the Cross river to some point on the Benue, east of Yola, which was fixed at a point near the mouth of the Faro by the supplementary agreement of Nov. 15, 1893, while the delimitation was further extended to a point on the southern shore of Lake Chad, about 40 miles east of Kuka, the capital of Borinn. By an agreement concluded between the English and French governments on Aug. 3, 1890, the limit between their spheres is a line from Say, on the upper Niger, to Barrawa, on Lake Chad, drawn so as to leave to the Niger Company all that properly belongs to the Kingdom of Sokoto. An agreement was made between France and Germany in 1894, by which Germany abandoned to France the *Hinterland* of the Cameroons, excepting the trade route to Lake Chad, permitting the French to extend the French Congo territory northward behind the Cameroons and east of the Shari to Lake Chad, and ultimately, if they forestall the English in Bornu or Wadai, to join their possessions on the Congo with the French Soudan, thus shutting out England from the central Soudan, and uniting in a continuous colonial empire the French possessions on the Senegal, the Ivory Coast colonies, the French Congo and Gabun, the French Soudan, the Sahara, and Algeria. The coast of the Sahara, north of the French coast of Senegambia, from Cape Blanco to Cape Juby, where England has some territory, has been conceded to Spain, which claims Adrar in the interior, but has not yet come to an agreement with France as to the limit of the protectorate. Spain has done nothing in recent times to establish a government in these territories, or to develop their resources. By a treaty made between France and Liberia in 1894, the Cavally river was made the boundary between their territories on the Ivory Coast, and the districts behind Liberia that were occupied

by the Sofas of Samory were acknowledged to be within the French sphere. In the same year the French republic made a treaty with the Congo State, conceding to the latter territory in the Welle region occupied by Congo troops, though it is north of the 4th parallel.

The extent of the Spanish protectorate is 243,000 square miles, with perhaps 100,000 inhabitants. The French colony of Senegal has an area of 14,700 square miles, and a population of 174,000. Including its dependencies, its area is 57,900 square miles, with a population of 1,029,540, not including protectorates having an area of 96,500 square miles, and about 80,000 population. There are 246 miles of railroad in Senegal. The Rivières du Sud and Futa-Jalon territory have an extent of 42,600 square miles, and about 600,000 inhabitants. The settlements on the Ivory Coast are Grand Bassam, Assinie, Grand Lahou, and Jackeville. From these a French protectorate has been extended over the Kingdom of Kong, and into the Soudan. On the Gold Coast there are French establishments at Porto Novo, Kotonu, Grand Popo, and Agoué, and a protectorate has been imposed upon the Kingdom of Dahomey, which has a population of about 600,000. The extent of the French possessions here is undetermined. The English seek to cut them off from those on the upper Niger. The French Soudan embraces all the region of the upper Senegal and the upper Niger. The annexed territories on the Senegal have an area of 54,000 square miles, and 360,000 population. The protectorates were estimated in 1891 to have an area of 230,000 square miles, and 2,500,000 population. The French Congo, including Gabun, with the territories on the Ubangi, has an area estimated at 300,000 square miles, with a population estimated at 6,900,000.

The British Niger protectorates are estimated to have an area of 500,000 square miles, with over 20,000,000 inhabitants; but this includes large areas that the French have not conceded to England. The British colony of Gambia, surrounded by French territory, has an area of 2,700 square miles, and a population of 50,000, including 62 whites. Sierra Leone has an area of 4,000 square miles, and had 74,835 inhabitants in 1891, of whom 224 were whites. The protected territories have an area of 11,000 square miles, and 105,000 inhabitants. The Gold Coast colony and protectorate, including Ashanti, are 46,600 square miles in extent with an estimated population of 1,474,000. Lagos, an island on the Slave Coast, with the protected territory on the mainland, has an area of 1,000 square miles, and about 100,000 inhabitants. Behind it is Yoruba, having 19,000 square miles, and 3,000,000 inhabitants.

Near Gambia, and inclosed likewise by French possessions, is Portuguese Guinea, for which an area of 14,000 square miles is claimed, with 800,000 inhabitants.

The German protectorates of Togoland and Little Popo have an area of 19,660 square miles, and 800,000 inhabitants. The area of Cameroons is 160,000 miles, and the population is 2,600,000.

The independent republic of Liberia has been diminished by English encroachments from Sierra Leone, and by French annexations in the

interior and on the Ivory Coast. The estimated area is 14,360 square miles, and the population is 1,068,000, of whom 18,000 are descendants of liberated American slaves.

Dahomey was conquered by the French army under Gen. Dodds in 1892 and 1893. King Behanzin was deposed, and his realm was divided into 2 kingdoms—Abomey, over which Agoli Agbo, Behanzin's brother was made king on Jan. 15, 1894, and Allada, where Ganhu Hugou, a fetish priest, was crowned. A French protectorate was secured by treaties signed on Jan. 29 at Abomey, and on Feb. 4 at Allada.

In the Soudan Col. Achinard, Governor and commander of the forces, had strict orders from the French Government not to extend the French occupation. Nevertheless Col. Bonnier, who was operating on the upper Niger with a flotilla against Samory, marched up to the city of Timbuctoo and took possession on Jan. 11, 1894. Finding his position menaced by Tuaregs, he led out a detachment of 70 native sharpshooters, with 10 European officers, for the purpose of warling them off and of obtaining food supplies, leaving the main body to hold the town. On Jan. 15 Col. Bonnier's force was surprised at Goundam by Tuaregs, and was annihilated. The French Government sent re-enforcements to avenge the disaster and to hold Timbuctoo, which could not now be evacuated without loss of prestige. The relieving column under Col. Joffre cleared the country of Tuaregs.

Samory, Emperor of the Sofas, the last of the Soudan conquerors, was expelled from the Niger valley and driven southwestward into Kong by the forces of Col. Combes early in 1893. Capt. Briguelet established a station at Erimankono, on the border of Sierra Leone, to prevent Billali, Samory's principal lieutenant, from obtaining arms from British merchants. Col. Achinard at the same time conducted an expedition against Ahmadu, the old enemy of the French, who had mounted the throne at Warina, in the same region. The presence of French troops there caused the British colonial authorities to display a military activity on the frontier, which, although a conventional line, was not precisely known. In the Niger basin also, and in Gambia, the British developed a military strength far beyond any they had shown before, though not equal to that of the French, who had organized an efficient native colonial army, while the British had to depend on negro troops imported from the West Indies and on marines. A British expedition was sent from Sierra Leone against the Sofas in Bambara and at Kerra Yemma. On Dec. 23, 1893, a small detachment of French troops under Lieut. Maritz was annihilated by a Jamaican regiment under Col. A. B. Ellis in Warina, each mistaking the others for the common enemy. On the British side Capt. Lendy and 26 men were killed. Both the British and the French Government claimed that the incident occurred within its own sphere.

In January, 1894, the British defeated the Sofas and captured Kerra Yemma and Warina, proclaiming a protectorate over the territory traversed, including the Sanda district of the Kono country. On Feb. 3, 1894, a second collision occurred between the French and the British police, who had established themselves at

Sama, within the sphere claimed by the French, and forced the natives to build roads. This attack, in which 5 were killed on the British side, was also held by the French Government to be due to a misunderstanding. Col. Montiel, who had been ordered to the Ubangi to take command of the forces there and conduct an expedition to the upper Welie, if not also to penetrate the Buland Gaud country and occupy it temporarily as a mediator in behalf of Egypt and the Sultan, as the English feared, was sent instead to operate from the Ivory Coast against the Sofas, and thus prevent the British from subduing them and occupying benefits therefrom. When Col. Montiel arrived at Grand Bamanu early in 1894 he found that no adequate provision had been made for the advance into Kong. The supplies and means of transport were not sufficient for the maintenance of more than 200 men out of more than 1,000 placed under his command. With this small force he undertook to advance and begin the campaign. Samory was more powerful than ever, having an army of 11,000 men well armed and well officered, and when Col. Montiel found himself confronted with a force so superior he retreated, abandoning three quarters of his baggage and guns. When he was already in full retreat, orders came from France countermanding the expedition.

On Jan. 31, 1893, British and French plenipotentiaries signed at Paris a new boundary agreement regarding the *diversion* of Sierra Leone. The line follows the watershed between the Mellakery and Grande Sauries rivers, the *Thalweg* of the Mela, the right bank of the Grande Sauries, crosses this river in a line drawn to the river Kita, follows its *Thalweg* down to the Loko, runs straight to a point on the Petite Sauries 4 miles south of 9° of north latitude, follows the *Thalweg* of the Petite Sauries up to that parallel which forms the boundary as far as its intersection with the watershed of the Niger, and follows this watershed, terminating at the parallel of latitude that passes through the source of the Touboulou or head waters of the Niger.

In the beginning of 1894 a force was sent to consolidate British authority on the Gambia. The troops attacked Padi Niala, the principal chief on the river, who would not acknowledge British sovereignty although Col. Ellis had destroyed his capital two years before. After the column had burned several villages Padi Niala's men surprised and defeated the British column, and subsequently ran to give a landing force in January, 1894. The West Indian regiment, commanded by Major Madden, subsequently drove the chief from his country, blowing up his town of Gouger and burning all his people's villages. He sought aid among the Wolof-Mandian chiefs on French territory for a fresh campaign against the British, but was made a prisoner by French troops in March. In April, 1894, the British made a treaty with Moussa Malah, whom they recognized as the king of the natives on the Gambia.

In the spring of 1894 Sir Francis Scott, Inspector general of colonial police, conducted an expedition to the borders of Ashanti for the purpose of incorporating certain tribes that were willing to accept British rule instead of that of

the King of Kumassi. The annexation of these tribes was accomplished without bloodshed, and a Houssa garrison was left at Attababoo.

By the Franco-German agreement of March 15, 1894, the fifteenth meridian east of Greenwich is recognized as the eastern limit of the German sphere of influence from 4° to 8° 30' of north latitude. The southern boundary of the Cameroons protectorate was defined by the Franco-German agreement of Dec. 24, 1885, as running from the mouth of the Campo river due east to about 15° of east longitude. Since then the French expeditions of Savorgnan de Brazza, Mizon, and Maistre have penetrated the German *Hinterland* from the Ubangi up to the Benue and Lake Chad, establishing stations on the Sanga river and the station and ivory depot of Gasa and making treaties with the local chiefs on the Sanga and Shari rivers and in the intermediate country. The German expeditions of Kund, Tappenbeck, Zintgraff, Gravenreuth, and Morgen never penetrated beyond the twelfth meridian in the south or the longitude of the English station of Yola in the north. The English were chagrined at the abandonment of the *Hinterland* to France in the new treaty. Kunde is reserved to France, although it was found to lie just west of longitude 15°. The German frontier is extended east of the fifteenth meridian in the south, so as to give to Germany the right bank of the Ngoko for a part of its lower course and 30 kilometres of the right bank of the Sanga for the development of the commercial interests of eastern Cameroons. In the north the German sphere is contracted above latitude 8° 30', where the line runs northwest to Lame and Bifara, which are included in the French possessions, and then due north to longitude 10°, giving France access to the Benue through its tributary, the Mayo Kebbe. It follows the tenth parallel eastward to the Shari beyond the seventeenth meridian, and includes the whole left bank of that river down to Lake Chad, thus giving to Germany a part of the territory of Bornu and the south shore of Lake Chad from the mouth of the Shari to the boundary of the English sphere, west of Deggela. The treaty secures to Germany the right of navigation on the Sanga and on the Shari, affording commercial communications with the Congo basin and the central Soudan.

The German administration in Cameroons received in 1894 a severe setback. The Soudanese soldiery mutinied and seized the arms and ammunition. They were subdued, but an investigation into the causes of the outbreak revealed the atrocious cruelty of the German officials, especially Leist, the head of the administration, who was promptly dismissed when it was proved that he had been guilty of inhumanity not only to the soldiers and native men, but to women.

In the spring of 1895 the Governor of the Cameroons, Herr von Puttkamer, carried on a campaign against the Bakoko tribes in the interior. The German forces stormed 4 of their strongholds, losing 12 killed and killing 200 tribesmen.

For two years the British carried on active operations for the subjugation of the Egbas and Jebus back of Lagos. In 1894 a naval force was sent to Beniu to reduce the chief Nana,

who refused to submit to the authority of the Niger protectorate. His town was stormed on Sept. 25, after which he delivered himself up at Lagos. In the autumn a British official named Ferguson proclaimed a protectorate over Salaga and other districts northwest of Togoland, although these were declared neutral in an Anglo-German agreement made in 1888. Herr Kling, Lieut. von Karnap, and Dr. Grüner led German expeditions into the *Hinterland* of Toga, while Capt. Decœur, M. Alby, Lieut. Baud, and M. Ballot, Governor of French Dahomey, as agents of France, traversed the same regions, and all obtained treaties from local chiefs in respect to some of the same territories that the mulatto Ferguson had negotiated for in August, 1894. Capt. F. D. Lugard, following Ferguson, obtained new treaties in Borgu. The Germans claimed the whole empire of Gando, which they said was independent of Sokoto, and also the lauds of Ilorin, Lokoja, Saria, and Keffi. They were extremely desirous of extending their protectorate to the Niger, but the French were unwilling to concede all their claims, because these would sever the Dahomey protectorate from the Soudan. In February, 1895, Capt. Toutée, crossing from Dahomey to the Niger, concluded various treaties. The French claimed Niki and Bussa as the *Hinterland* of Dahomey, but the English held that the treaty line from Say to Barua precluded them from acquiring any rights within the bend of the Niger or even in Bornu or Adamawa. The King of Bariba, or Borgu, signed a treaty for Capt. Lugard on Nov. 15, 1894, at Niki; but Capt. Decœur, who obtained a political treaty on Nov. 26, believed the English document to be a commercial arrangement only. Lieut. Mizon had obtained a protectorate treaty from the ruler of Adamawa in August, 1893, and had left a force at Yola; but the English claimed Adamawa as a dependency of Sokoto, although they had previously conceded it to Germany, and Germany had resigned her rights to France. The French and the Germans persistently denied that the British Niger Company had ever concluded a political treaty with the Sultan of Sokoto or the other potentates, asserting that the treaties simply extended to Europeans in general the right to trade subject to the payment of tolls to the native rulers. Many complaints have been made, both by the French and by the Germans, of the stopping of trading vessels and expeditions by the Niger Company in contravention of the Berlin act of 1885, which made the Niger free to the flags of all nations. Indemnity has been paid for the illegal seizure of vessels; but this has not deterred the company from repeating the act in order to defeat the commercial and political designs of its foreign competitors. Toward the close of 1894 a French gunboat, the "Ardent," entered the Niger for the purpose of succoring the French post at Yola, but ran upon a sand bank, and could not be got off for six months. The French Government ordered the commander to return to the sea with his vessel, which he did as soon as the water rose. The company's officials, who had allowed the gunboat to proceed, because they had not the force to stop it, arrested a German steamer that entered the river with supplies for the stranded vessel.

Ashem, Sultan of Bornu, was defeated and his capital, Kuka, was taken by Raah, once a slave and afterward a trusted lieutenant of Zobeir in the Egyptian Soudan, who, on the rise of the Mahdi, had fled with a band of fighting men and subjugated Baghirai before he conquered Bornu. He established his rule in Bornu, imposing a tax of a dollar on every inhabitant. Kiari, nephew of the fallen sultan, raised a force to expel the invaders and attacked them several times, but was always repelled.

The French expedition from the Ufangi that Col. Montell was to have led set out in October, 1894, pushed 900 miles to the northeast, and in the spring of 1895 occupied territory near the Bahr el Gazel and bordering on the country held by the dérivistes.

The people of Brasa, in the Niger territory, revolted against the British authorities and pillaged the station of Akassa on Jan. 28, 1895. The rising was put down by British marines and troops of the protectorate under Sir Claude Macdonald. The British captured and burned Nimbi, King Koko's town, on Feb. 22. The hostility of the natives here and elsewhere in the forest belt was occasioned by the determination of the English to deprive the negro traders and porters of the commerce that they have always monopolized, none others being allowed to transport goods between the coast and the interior through their territory. The same cause led to the imprisonment of Nana and the rebellion of Jaja.

In February, 1894, the British Government presented to Prempeh, King of Kumassi, the remnant of the Ashanti empire that was disrupted by the British conquest of 1874, an agreement to sign, accepting a British resident. This he refused to do, and on June 11 he proclaimed the restoration of the empire of his fathers and was formally enthroned as King of Ashanti. He appointed his brother and two cousins ambassadors to lay his objections to British rule before the English Government. Though the Governor of the Gold Coast, Sir Brandford Griffith, refused permission for them to start and the British Government gave notice that no envoys would be received from a ruler so unimportant as the King of Kumassi, for his title to the throne of Ashanti was not recognized, from one, moreover, who countenances human sacrifices, yet the embassy went to England and appealed to the Government for a hearing, which was refused. A British expedition was prepared, and an ultimatum was sent to King Prempeh, reiterating the former demands that he put an end to slave raiding and human sacrifices, cease hampering trade, and accept a British protectorate and a British resident who should direct him in all relations with his neighbors. In answer to this ultimatum, which expired on Oct. 31, the young king denied that he countenanced or permitted slave raiding or human sacrifices or hindered trade, and declared that he preferred war to resigning his prerogatives into the hands of a British agent. The king, who ruled over an industrious population of 2,000,000 fighting men, was reported to have 30,000 fighting men, armed with rifles. The British expeditionary force consisted of 700 British troops, 500 West Indians, and 300 picked men from English regiments. The command was

given to Sir Francis Scott, lieutenant of colonial affairs for the Gold Coast. The English relied upon their Maxim guns and upon native allies, neighbors, and enemies of King Prempeh, to whom were supplied 4,000 rifles. The British force marched to Kumassi, encountering many difficulties. There was no fighting, for Prempeh, conscious of the futility of mounting against the power of England, succumbed without firing a shot.

WEST INDIES. The West Indian islands, except Haiti (see Haiti) and Cayman (see Cayman), are all occupied by European colonies. Cuba and Puerto Rico are the only remaining Spanish colonies in America (see CUBA). The majority of the inhabitants are descendants of the former negro slaves, who constitute almost the entire population on many of the islands. The staple products on all the larger islands are sugar and rum, and these have suffered a continuous economic depression, owing to the competition of the beet-root-sugar industry of Europe, which is stimulated by bounties. A partial recovery has been brought about in the British colonies by the substitution of fruit culture and other new industries. Wages having fallen almost to the lowest life-supporting level, there has been a large emigration to the United States of young colored men, most of whom have received a good elementary education.

British Colonies.—The British possessions are divided into 6 groups, each of which has its own Government and its separate administration.

The Bahamas have an area of 3,420 square miles and a population of 45,151, nearly one third of whom are white. The Governor is the William F. Hayses Smith, who was transferred from the Leeward Islands in January, 1901. The product of the sponge fisheries in 1901 was valued at £28,613; export of pineapples, £17,096. The cultivation of the steel plant, introduced from Yucatan in 1890, and the raising of cotton has been begun. Shell, pearls, and ambergris are other products. There were 1,399 births and 1,191 deaths in 1901; average school attendance, 2,291.

Jamaica has an area of 106 square miles, with about 195,000 inhabitants. The births in 1901 numbered 8,652, and the deaths 4,268. There were 201 primary schools, with an average attendance of 16,806. The Governor is Sir J. S. Bay. The land is divided into sugar estates, outside of which the following population lives in very crowded areas. The death rate has increased from 41.54 per 1,000 before 1870 to 24.40 in 1904, and yet the population has grown at the rate of almost 10 per cent. per annum. The headquarters of the European troops in the West Indies is here, the garrison consisting of 40 officers and 319 men.

Jamaica, with Tort's and Caton's islands has an area of 4,624 square miles, with a population of about 300,000, including 12,000 whites and 12,000 East Indians. The school attendance in January is 22,392; the births in 1901 numbered 24,475, and the deaths 12,172. The West Indian regiments have a strength of 1,250 officers and men. There are 119 miles of railroad and 100 miles of telegraph. The revenue in 1901 was £265,544, and expenditure £289,413; exports, £2,072,690; imports, £2,137,794.

The *Leeward Islands* have an area of 706 square miles and 129,470 inhabitants, of whom 5,000 are white. The Governor is Sir Francis Fleming. The budgets and commerce of the 5 presidencies in 1893 were:

PRESIDENCIES.	Revenue.	Expenditure.	Imports.	Exports.
Virgin Islands.....	£1,553	£1,715	£3,885	£4,643
St. Kitts, Nevis, and Anguilla.....	53,850	51,975	184,192	181,592
Antigua.....	50,881	50,870	178,991	188,958
Montserrat.....	8,371	7,882	29,925	26,774
Dominica.....	22,947	20,818	64,552	61,308

Trinidad has an area of 1,754 square miles, with 220,285 inhabitants. Tobago, which is connected with it administratively, is 114 square miles in extent, with 18,353 inhabitants. There were 7,568 births and 5,987 deaths in Trinidad in 1893. There are 173 schools, with 18,483 pupils. The pitch lake in the center, which is leased to an American company, produced 90,204 tons of asphalt in 1893. There are 54 miles of railroad and 136 miles of telegraph. The Governor is Sir F. Napier Broome. The revenue of Trinidad in 1893 was £497,396, and the expenditure £488,503. Imports amounted to £2,270,885, and exports to £2,320,824. The chief exports are sugar, cacao, and molasses. The exports of Tobago, which produces cotton, tobacco, and sugar, were valued at £25,429.

Of the *Windward Islands*, which have Sir Charles Bruce for their Governor, Grenada has an area of 133 square miles and 56,413 inhabitants; St. Vincent, an area of 132 square miles and 40,954 inhabitants; and St. Lucia, an area of 243 square miles and 43,310 inhabitants. The products are sugar, cacao, cotton, spices, coffee, rum, arrowroot, logwood, and timber. The finances and trade of the islands in 1893 were as follow:

ISLANDS.	Revenue.	Expenditure.	Imports.	Exports.
St. Lucia.....	£51,598	£40,271	£165,978	£178,429
St. Vincent.....	25,495	29,589	93,424	114,694
Grenada.....	59,210	58,089	166,679	316,063

Danish Colony.—The islands of Santa Cruz, St. Thomas, and St. John, constituting the Danish Antilles, of which C. E. von Hedemann is Governor, have an area of 118 square miles and a population of 32,786, consisting almost entirely of negroes engaged in the cultivation of the sugar cane. The imports in 1893 were valued at 317,986 kroner, and the exports at 195,511 kroner.

Dutch Colony.—Under the Government at Curacao are the islands of Curacao, Bonaire, Aruba, St. Eustache, Saba, and the Dutch part of St. Martin. The negro inhabitants are engaged in cultivating corn and beans, cattle raising, and the production of salt and lime. Curacao, which is a free port, has a large trade with other West Indian islands.

French Colonies.—These are Guadeloupe and the adjacent islands of Marie Galante, Les Saintes, etc. There were 49 primary schools, attended by 9,753 pupils. The local revenue for 1894 was estimated at 5,551,619 francs, the expenditure of France in 1895 at 1,596,832 francs. There are 60 miles of railroad. The

products besides sugar are cotton, ramie, tobacco, coffee, cacao, rubber, cattle, corn, rice, and potatoes. The imports amounted to 20,456,000 francs, and exports to 15,164,000 francs in 1891.

WEST VIRGINIA. a Southern State, admitted to the Union June 19, 1863; area, 24,780 square miles. The population, according to each decennial census since admission, was 442,014 in 1870; 618,457 in 1880; and 762,749 in 1890. Capital, Charleston.

Government.—The following were the State officers during the year: Governor, William A. MacCorkle, Democrat; Secretary of State, William E. Chilton; Treasurer, John M. Rowan; Auditor, Isaac V. Johnson; Attorney-General, Thomas S. Riley; Adjutant General, J. A. Holley; Commissioner of Labor, J. M. Sydenstricker; Superintendent of Public Schools, Virgil A. Lewis; Bank Examiner, C. A. Wever; State Librarian, E. L. Wood; Secretary of the Agricultural Board, C. C. Brown; Meteorologist, W. W. Dent; Secretary of the Board of Health, N. D. Baker, M. D.; State Veterinarian, E. E. Terry; Secretary of the Fish Commission, C. I. White; Commissioner of Immigration, Thomas Popp.

Finances.—The State is out of debt. The estimated receipts and expenditures for the fiscal year ending Sept. 30, 1895, were as follow: For the State fund, \$656,600, with balance of \$127,138.36, making a total of \$783,738.36. The estimated charges are \$577,318.30, leaving a balance of \$206,420.06. For general school fund, \$351,883.30, with balance of \$313,683.40, making a total of \$665,566.70; for school fund, \$28,000, with balance of \$282,745.91, making a total of \$310,745.91.

State Institutions.—The Legislative Committee reported the Weston Hospital as overcrowded. The hospital at Spencer had 70 men and 75 women patients. The Penitentiary reported \$4,017.05 unexpended balance and 240 convicts at work and 136 unemployed. The Colored Institute, at Farms, had arranged for the erection of the new Mechanical Hall for which \$6,000 had been appropriated. The Reform School had a balance on hand of \$12,581.44.

Education.—The university has a new chemical laboratory, and \$40,000 has been expended upon new machinery in Mechanical Hall. Part of the funds for the university is supplied by the State, and it also derives \$20,000 a year from the Morrill fund for scientific instruction, besides the interest on the original endowment. The agricultural experiment station is maintained by the United States Government.

A preparatory branch of the university, for which the Legislature appropriated \$13,000, is to be located at Montgomery.

An officer of the United States army is in command of the cadet corps. The enrollment of the university was 340, an increase upon any previous year. The whole cost of the buildings is \$200,000.

Legislative Session.—The Legislature was convened in January, and adjourned in March. Its most important enactments were as follow:

Enabling an insolvent debtor to prefer a creditor for the purpose of giving security for loan made at

the time of the transaction, but not to prefer a creditor as a pre-existing debt.

Providing that two days' work shall be performed on the public roads before the first day of June in each year.

To prevent the owner or occupant of any shanty boat from anchoring his boat on real estate belonging to another for more than twelve hours.

Establishing the county of Mingo out of part of the county of Logan.

Providing that towns of fewer than 300 voters may hold municipal elections under the law in force prior to the adoption of the Australian ballot system.

Reducing the number of regents for the State University from 14 to 9, 5 of whom are to be appointed from the dominant political party; and requiring the regents of the State Normal School to be equally divided between the two political parties.

Amending the divorce statute so as to enable one to get an absolute decree of divorce on the ground of cruelty or ill treatment.

Requiring railroads to use the classification of freight used by them for interstate traffic; and prescribing a tariff increasing slightly the charges on short hauls and decreasing the charges on long hauls.

Making it unlawful for any railroad company to engage in the business of buying and selling coal or to lend its credit or money to another engaged in the business.

Authorizing the county court of any county to issue bonds for the purpose of funding its indebtedness.

To authorize married women to convey property by an attorney in fact; the property of a married woman, when living apart from her husband, not to be subject to her husband's disposal nor liable for his debts.

Making a fence built wholly of barbed wire a lawful fence.

Fixing the fees for catching and securing floating timber.

Providing for a series of text-books for the public schools of the State, and fixing the price therefor.

Imposing a license tax of \$500 on cigarette dealers.

Allowing a lot owner in property where the entire tract has been returned delinquent for nonpayment of taxes to redeem such part of the property as he may own instead of the entire tract.

Among the charters amended were those of Charleston, Huntington, and Parkersburg.

Railways.—The total certified assessment for 1895 of all the property of the various railroads in the State is \$22,432,791. The mileage is about 2,000.

Several railroads are being built to open up rich territories. Among them are the road from Charleston to Sutton, up the Elk, to connect with the West Virginia and Pittsburg, thus making a line north and south through the center of the State; the West Virginia Short Line road from Clarksburg to New Martinsville; and the Chesapeake and Western to extend from the Chesapeake Bay through Fredericksburg and Harrisonburg, Va., into the eastern coal field. In addition there is a road up Guyandotte river from Huntington, to extend eventually into Virginia; a road from Morgantown to Kingswood; a road from Burlington to a rich territory in Randolph County; the Cairo and Kanawha Valley road; and the West Virginia Southern, which is now being constructed up Lewis creek from Brownstown and will open up a coal and timber territory.

Oil.—While the oil belt extends for 300 miles across the State, only a few counties have been tapped. The Sistriville field leads in productiveness, outranking all others in the Union. The

Monroe County field is small, but producing well. Wells in Wetzel County have given from 25 to 35 barrels a day.

Coal.—The total output in 1894 was 11,021,757 short tons. The average annual increase for fourteen years has been 719,551 tons.

Timber.—The mills on the Great Kanawha employed 400 men and boys, with a weekly pay roll of over \$4,000. Mills in other territories showed pay rolls of \$600,000 monthly, not including logging operations, saw mills, and the great ice industry.

Agriculture.—The State board is organized under the enactment of 1893. The fiscal year begins on July 1; \$1,000 is appropriated for the expenses of the board, with \$1,000 for the secretary.

WISCONSIN, a Western State, admitted to the Union May 29, 1848; area, 52,920 square miles. The population, according to each decennial census since admission, was 200,201 in 1850; 775,281 in 1860; 1,024,670 in 1870; 1,313,427 in 1880; and 1,820,980 in 1890. By the State census of 1890 it was 1,817,403. Capital, Madison.

Government.—The following were the State officers during the year: Governor, William H. Upham, Republican; Lieutenant Governor, Emil Baensch; Secretary of State (who also acts as Auditor), Henry Casson; Treasurer, Rowell A. Peterson; Attorney General, William H. Mason; Adjutant General, Charles King; Superintendent of Public Instruction, John A. Finney; Commissioner of Insurance, William A. Frecker; Railroad Commissioner, D. J. McKinnon; Chief Justice of the Supreme Court, Harlow A. Oman (who died July 4), and afterward John R. Casaday; Associate Justices, John T. Finney, John R. Windley, and A. W. Newman; Clerk of the Supreme Court, Ruyser D. Marshall.

Legislative Session.—The Legislature met March 9, and adjourned April 18. To meet the needs of the State University a tax to produce \$120,000 for each of two years was authorized. An appropriation of \$100,000 was made toward the erection of a fireproof building for the protection of historical collections. Appropriation was made for the improvement of the State Prison; a board of arbitration was created; the Board of Control was reorganized; laws prohibiting the cheese and butter industries were passed; and a reorganization of the State was provided for, based upon population and territory. Among other laws enacted were several to secure conformity with those of other States relating to acknowledgment of written instruments; to the presentation of notes, checks, drafts, or bills of exchange; and abolishing days of grace; to the establishing a standard of weights and measures; to the execution of wills; to the probate in the State of foreign wills; and to the sealing of deeds and other written instruments. Other acts were:

Providing for the better supervision of banks;
Incorporating public warehouses;
Providing for inspecting, weighing, storing, measuring, and shipping grain within certain cities;
To provide for a State Board of Arbitration and Conciliation;
To provide for the appointment of a departmental commissioner.

Declaring meandered lakes public waters.

To provide for fishways in the dams on and across all streams in the State.

To provide a contingent fund to be used for prevention of dangerous diseases.

To authorize formation of a mutual insurance company to insure against hail, tornadoes, cyclones, and hurricanes.

To prevent unjust discrimination by insurance companies.

To promote the establishment and efficiency of free public libraries in the State.

Fixing the age of consent at fourteen years.

Finances.—From the report of the Treasurer for the fiscal year ended Sept. 30, 1895, the following statements are taken: The amount on hand in the general fund at last settlement, Sept. 30, 1894, was \$977,315.71; the receipts during the year from all sources were \$1,788,809.52. The disbursements were \$2,729,506.73, and the balance on hand at the close of the fiscal year was \$36,618.50. Among the items of disbursement are the following: Salaries and permanent appropriations, \$200,641.94; legislative expenses, \$161,411.69; State Hospital for Insane, \$113,702.79; Northern Hospital for Insane, \$137,694.55; State Prison, \$87,399.97; School for Deaf, \$41,050.58; School for Blind, \$30,978.84; Industrial School for Boys, \$74,161; State public schools, \$47,036.47; clerk hire, \$66,594.16; labor about the Capitol, \$48,821.38; transient laborers, \$11,294.11; militia, \$93,684.55; free high schools, \$47,000.08; maintaining chronic insane in county asylums, \$301,796.80.

The school fund amounted to \$3,371,657.94; the university fund to \$212,204; the agricultural fund to \$271,270.06; the Normal School fund to \$1,819,421.20; the total investment of trust funds being \$5,674,553.20.

The amount paid by railroad companies during the fiscal year was \$1,175,752.52; by telegraph companies, \$9,999.45; by telephone companies, \$9,838.99; by sleeping-car companies, \$503.80. Insurance licenses amounted to \$131,574.60, and peddlers' licenses to \$19,663.38.

The tax levy for 1895 amounted to \$1,372,713, which was divided as follows: One-mill tax, \$603,473; certificates of indebtedness to school fund, \$157,570; university tax, \$256,476; normal-school tax, \$120,694; free high schools, \$50,000; fifth normal school, \$10,000; manual-training schools, \$2,500; Feeble-minded School, \$100,000; special for normal schools, \$72,000.

The report of the Railroad Commissioner for 1894 says that the mileage of the State is 578 miles, an increase of 219 miles. The capital stock of the companies amounts to \$112,394,000; funded debt, \$160,400,000; unfunded debt, \$6,300,000; cost of railway properties in the State, \$230,000,000; cost per mile, \$40,000. The amount received from the companies for 1894 was \$1,295,999.13. There were 116 persons killed and 281 injured on the tracks.

Education.—The apportionment of the school-fund income for 1895, amounting to \$602,268.48, was made on the basis of 89,431 cents for each person of school age in the State. The last Legislature authorized the establishment of a State home for the 3,000 feeble-minded persons in Wisconsin, and appropriated \$100,000 therefor, and in October it was located at Chipewa Falls. Superior was decided upon in July

as the site for the new normal school, contingent on the paving by the town of the streets surrounding the school.

State Prison.—The Legislative Committee appointed by Gov. Peck to visit the charitable and penal institutions of the State reported to the Legislature of 1895, condemning the State Prison at Waupun, on account of its unsanitary and overcrowded condition, as wholly unfit for a reformatory, and advising the erection of an intermediate prison in a central county.

Census.—A State census taken this year gives the official population as 1,937,915, an increase of 374,502 since the taking of the State census in 1885. The expenditure from the general fund for this work this year was \$77,219.84. The Legislature provided that as soon as the result of the census was known an apportionment committee should prepare a bill districting anew the members of the Senate and Assembly according to the number of inhabitants. This apportionment was made in November.

The Gold Cure.—A law passed by the last Legislature provided for compulsory subjection of inebriates to this cure. Statistics gathered in October show that in only 25 of the 75 counties have judges availed themselves of the law; in these the number of treatments was 137 at a cost of \$17,030. Objection to the law is made by many magistrates on the ground of the large expense involved, as well as a belief that it is unconstitutional.

Immigration.—In pursuance of the effort to secure settlement of the 25,000,000 acres of unoccupied land in Wisconsin, an immigration commission visited New York to make a personal investigation of the character of the immigrants and other matters connected therewith, and to provide for the circulation among desirable immigrants of literature giving facts relative to the lands they desire to settle. For this purpose a handbook of was prepared.

Dairy Industry.—Wisconsin has \$160,000,000 invested in the dairy industry, and the milk products of 1894 aggregated \$30,000,000.

Treasury Cases.—As stated in the "Annual Cyclopadia" for 1893, ex-State Treasurers were under obligation to repay to the treasury interest collected and used by them accruing from the deposit of public funds, with interest thereon. The last Legislature passed an act releasing ex-Treasurers Baetz and Kuehn from judgment in the treasury cases, and ex-Treasurer McPetridge from the balance over principal and 3-per-cent. interest. It was claimed that this act was contrary to the Constitution; but the Attorney-General decided that it was constitutional, and took action accordingly.

Decision.—The Supreme Court sustained the validity of the law which provides that life imprisonment works absolute divorce without further legal proceedings.

WYOMING, a Northwestern State, admitted to the Union July 10, 1890; area, 97,890 square miles. Population in 1890, 60,705. Capital, Cheyenne.

Government.—The following were the State officers during the year: Governor, W. A. Richards, Republican; Secretary of State, Charles W. Burdick; Treasurer, Henry G. Hay; Auditor, William O. Owen; Attorney-General, B. F.

Fowler; Adjutant General, Frank A. Stitzer; Superintendent of Instruction, Estelle Reed; Chief Justice of the Supreme Court, H. V. S. Grosbeck; Associate Justice, A. R. Conway, C. N. Potter; Clerk of the Supreme Court, R. H. Redpath.

Finances.—The Auditor's report gives the following information as to the financial condition of the State: Balance in the treasury Sept. 30, 1894, \$148,336.16; moneys received from all sources during the year ending Sept. 30, 1895, \$184,490.34; total receipts, \$332,825.50. The disbursements were: General fund (on account of appropriations), \$160,249.69; Capital tax, \$5,618.97; bond tax (interest on State debt), \$19,200; university income tax, \$3,691.71; stock indemnity, \$1,507.81; fund for the insane, \$10,405.04; hospital maintenance tax, \$6,055.33; hospital building tax, \$275.86; Capitol building fund, \$1,893.37; inspection fund, \$790.65; Rawlins penitentiary building tax, \$12,494.31; total disbursements, \$223,182.74; cash in treasury, Sept. 30, 1895, \$110,642.76. The annual expense is materially increased every alternate year by the assembling of the State Legislature, and in this year's expenditures are included the expense of the third Legislature and the payment of bounties on predatory wild animals, the latter a charge heretofore borne by the several counties.

The balances in all appropriations Sept. 30, 1894, and the appropriations since made amounted to \$380,995.39; there was paid over during the year \$160,249.69; restored to general fund, \$4,938.20; and there remained Sept. 30, 1895, balances amounting to \$215,807.50. For the construction of public buildings \$17,695.20 was paid out during the year, making the total expense of construction since 1883 \$564,262.20. Of this sum, \$297,273.49 has been expended for the Capitol at Cheyenne.

Valuation.—The property valuations of 1895 amounted to \$29,838,938.79, a gain in value during the year of \$640,897.59. The valuation of land and improvements on land was \$6,857,698.69; of town lots and improvements thereon, \$5,497,842.49; of capital employed in merchandise and manufactures, \$1,488,271.60; of moneys and credits, \$524,098.84; of stock in corporations, \$307,795.02.

The rate of the State levy for 1895 was 0-2535 mills, the assessment amounting to \$186,866.33. This levy includes a levy of a half mill authorized by the third Legislature for the support of State charitable institutions, which levy produced \$14,919.46. The total tax to be collected is \$845,000, exclusive of the school poll tax in Albany and Fremont Counties. The amount of delinquent taxes Sept. 30, 1895, was \$17,321.57, and \$395.32 was paid during the fiscal year as interest on delinquent taxes.

Railroads and Telegraphs.—The number of miles of railroad operated in the State during 1895 was 1,177.54, valued at \$7,127,281, an increase in mileage over 1894 of 20-19 miles, and a decrease in valuation of \$49,461. The valuation of Pullman palace cars was \$283,200, and the mileage proportion of the value in Wyoming was \$84,037, the mileage for these being 818-43 miles.

The mileage of the telegraphs was 1,019.6, and the total valuation \$107,186.50. For the Western

Union Company this valuation is made up as follows: The rate per mile for poles and line wire is \$30, and \$15 is added for each additional wire.

Bounties.—To encourage the destruction of predatory wild animals, the third State Legislature passed a law authorizing the payment of \$3 for each gray or black wolf killed and \$1 for each coyote, and made an appropriation for this purpose of \$25,000. Between Feb. 18 and Sept. 30, 1895, \$2,544 was paid for coyotes and \$4,000 for gray and black wolves, a total of \$6,544, and on Dec. 19 a total of \$11,000 had been paid.

Banks.—An abstract of the statement of the condition of the 4 State banks, July 17, 1895, shows their resources as \$228,235. The deposits subject to check were \$98,919; demand deposits, \$17,245; time deposits, \$20,000. The report shows all the banks to be in a healthy condition, and having on hand and available in cash over 30 per cent. of the total liabilities.

Live Stock.—The valuation for 1895 of the 300,264 cattle in the State was \$3,473,141.30; of the 73,318 horses, \$1,517,399.82; of the 1,807 mules and asses, \$69,096; of the 1,123,029 sheep, \$1,762,800; and of the 3,222 swine, \$30,022, making the total valuation of live stock amount to \$6,852,079.32.

Public Lands.—The total area of public lands in the State vacant and subject to entry June 30, 1895, was 42,609,548 acres, of which 7,976,414 have not been surveyed. The area in railroad selections was 143,137-99 acres.

Education.—The College of Agriculture was reorganized at the opening of the school year, with additional buildings, laboratories, and instructors. The total amount available for its support for the year ended June 30, 1895, was \$21,774.78, of which \$4,782.46 remained expended at the end of the year. The Wyoming Experiment Station issued 6 bulletins during the year, and conducted a stock-feeding experiment, which will be made the subject of a seventh. The appropriation for the year was \$15,000, all of which was expended, as was an additional sum of \$477.22 received from the sale of farm products.

Soldiers' Home.—In accordance with the suggestion made by the Governor in his message to the third Legislature, an appropriation of \$7,500 was made for the establishment of a home for veterans, a board of trustees was organized, and repairs were begun to the State building erected for a deaf, dumb, and blind asylum to be used as a home.

Insurance.—The report of the Auditor of the Office Insurance Commission shows that at the beginning of the year the life insurance in force amounted to \$5,332,908, on which a premium of \$139,223.99 was paid. In addition to this there was \$2,436,969 of life insurance in the amount of compensation. The amount of losses paid was \$97,659.92. The 41 fire insurance companies entitled to do business in the State wrote insurance in 1894 in the amount of \$6,779,334.95, on which \$121,849.39 was paid as premiums. Losses amounting to \$49,960.31 were incurred, and losses to the amount of \$52,968.39 were paid.

Sisaline.—Great losses have been based upon the value of sisaline (Polyglossum moniliforme)

as a forage plant. It was expected to grow with such luxuriance as to furnish shade in summer for cattle and a wind break in winter, as well as food, but the experiment station reports: "Our trials indicate that sucaline is not sufficiently hardy to be of any practical value in any part of the State."

Report is also made that both the Canada and the Russian thistle have secured a foothold in Wyoming.

Indian Troubles.—In the early part of the summer Bannock Indians and others, from reservations in Idaho, entered Wyoming and hunted, thereby breaking the laws for the preservation of game. Certain of the Indians being arrested by the constable of Jackson Hole—which is south of and very near Yellowstone Park—tried to escape, when one Indian was killed and six others were wounded. This was on July 13. The settlers at Jackson Hole organized to drive the Indians from the Hoback basin, where they were assembling, and the Governor of Wyoming demanded of the General Government that it should return these Indians to their reservations in other States. Cavalry and infantry were sent to the neighborhood, when, within a reasonable period, the Indians peaceably dispersed. The Indians claim that they received insufficient rations and were hunting for necessary food on unoccupied land, as they had a treaty right to do. The settlers assert that they were killing game for the hides. The United States deputy marshal who investigated the trouble says, in his report, that "the killing of game by Indians and the increasing number of tourist hunters threatens to deplete the region of big game—deer, elk, moose, etc.—so as to jeopard the occupation of the professional guides at Jackson Hole. It was decided at the close of last season to keep the Indians out of the region this year, and the several events this summer are the results of carefully prepared plans." He also says it was decided that some one should be killed, so that the matter could be brought before the courts, and he justifies the action of the Indians, of whom 3 in all were killed. The State contends that the lands on which the In-

dians were hunting were not unoccupied; that the admission of Wyoming to statehood gave the State the right to make proper police regulations; and that the game laws are proper police regulations, and apply to Indians as well as to white men.

Legislative Session.—The third Legislature convened on Jan. 7, and continued in session forty days, during which period it enacted 126 laws. Among these was a general law for the incorporation of cities having over 4,000 population; an act allowing verdicts to be rendered upon a concurrence of three fourths of the jurors; an act providing that a party producing a witness is allowed to impeach him by proving prior contradictory statements; and an act whose object is to preserve the few remnants of the buffalo by an absolute prohibition of the killing of that animal. Provision was made for the establishment of a Home for Soldiers and Sailors, with an appropriation of \$7,500, and \$2,500 was voted for the construction of a fish hatchery at Sundance. A bill was also passed accepting the 1,000,000-acre grant of arid land under the Carey act, and providing terms and conditions under which the land shall be selected and reclaimed, and an act to regulate the formation and procedure of guarantee and surety companies was passed.

Since 1893, when the Legislature failed to elect a Senator, Wyoming has been represented by Joseph M. Carey only, whose term expired in March of this year. On Jan. 8, 1895, the Republican members of the Legislature in caucus nominated Clarence D. Clark for the short term, to end on March 3, 1899, which seat was vacant, and nominated Francis E. Warren to succeed Joseph M. Carey, who did not get a single vote. The opposition to Senator Carey was due to his votes in the Senate against the free coinage of silver. On Jan. 22 both houses proceeded to an election with the following result: Short term—Clark (Republican), 47; Samuel T. Corn (Democrat), 6. For six years from March 4, 1895—Warren (Republican), 47; William H. Holliday (Democrat), 6.

Y

YACHTING IN 1894 AND 1895. Following the unprecedented activity of the racing season in 1893, as described in the "Annual" for that year, there came a period of comparative quiet, or at least of indifference on the part of the general public. It was then believed that the development of the sailing yacht had reached a point where the outlay was no longer justified by the conditions. The building of 9 large "single stickers"—5 American and 4 British—overstocked the market for such craft. In American waters when a vessel of this size has won in the trial races and served her purpose in successfully defending the "America's" cup she is of little use for pleasure yachting, and is usually altered into a schooner, or in some way adapted to the needs of her owner.

In British waters the conditions are somewhat different, since the whole coast of the United

Kingdom is within easy sailing distance, and it is possible to arrange a series of races offering attractive inducements to yachtsmen throughout the season. The Prince of Wales's cutter "Britannia," built after G. L. Watson's design, had unequalled success as a sailing yacht. At the close of the season of 1895 she was easily champion of the British sailing fleet. Some of her successes were no doubt due to the intense loyalty of the British yachting public to the prince. To be one of the "Britannia's" crew is the highest honor within the reach of the English sailorman, and her outfit is probably the most perfect, from the yachtsman's point of view, that is attainable in the wide world. Beyond all this, however, is the undoubted excellence of her model and her proverbial "luck," which is a powerful element in the estimation of seagoing folk, however much it may be despised by the matter-of-fact

landsman. The "America's" cup is the only prize that appears to be beyond "Britannia's" reach. There have been rumors at times that she would cross the ocean and at least try for this coveted trophy, but the regrettable incidents of 1895 have probably placed a veto upon any such undertaking.

"Vigilant," the winner of the international races of 1893, was for sale during the ensuing winter, and was purchased by Mr. George J. Gould, of New York, and sent across the ocean early in the season of 1894 to take part in as many regattas as were open to her. While she was beyond question a fast boat, she embodied a last attempt to combine keel and centerboard in one craft. Her centerboard always bothered her even in home waters, and when she reached the coast of Britain it seemed to take especial delight in justifying the distrust that the English have always cherished for that useful and effective contrivance.

Americans may perhaps be pardoned for feeling a certain pride in the fact that no American pilot has ever permitted a British cup-challenger to run aground during an important race, and it is equally to the honor of British yachtsmen that they used very plain language in regard to the British pilot who three several times ran "Vigilant" upon the rocks, and finally knocked the centerboard out of her altogether, disabling her for the most important race of the season—that for the Cape May cup.

The first race for which "Vigilant" was entered (the Clyde Regatta of July 5) saw a grievous mishap, in which most fortunately the sole American yacht was not concerned. "Valkyrie," "Vigilant's" antagonist of the year before, was run down and sunk by "Satanita." "Satanita" was laid up for repairs for some time, leaving "Britannia" and "Vigilant" to do all the racing in the 90-foot class.

Altogether they sailed 18 races, of which "Britannia" won 11, "Vigilant" 6, and "Satanita" 1. Almost all the stated regattas of British waters are sailed over sheltered courses where frequent turns are necessary and where "true" winds are the exception rather than the rule. Whenever "Vigilant" had an open sea before her and a "strong and steady wind" she gave a good account of herself. "Under such conditions," wrote a British naval officer, George Leigh Blake, "'Britannia' can not look at her." When all is said, however, it must be admitted that the result of "Vigilant's" expedition to British waters was not very satisfactory, though she brought home a number of very handsome silver cups to prove that she was no mean antagonist even for "Britannia" in her own home waters. It is very much to be regretted that she was prevented by the loss of her centerboard from sailing the cross-channel race to Cherbourg and back, which would have afforded a fairer opportunity for comparing the two boats than was given by all the other races combined.

1895.—After his plucky but unsuccessful contest for the "America's" cup in 1893, Lord Harewood, as has been related, lost "Valkyrie II" in collision with "Satanita." He very soon challenged anew for the "America's" cup, and placed an order with his former designer, Mr. G. I. Watson, for "Valkyrie III." As soon as the

conditions for the race were fairly agreed upon steps were taken by the New York Yacht Club to secure a worthy antagonist for what must needs prove a formidable craft. The necessary funds were promptly provided and the order placed with the Harland & Wolff Brothers, of Bristol, B. I., who since the death of Mr. Edward Burgess have attained the first rank among American designers.

For the first time in the history of the cup races the centerboard was discarded, to the great delight of the "cutting faction," who had for years been endeavoring to banish it from racing yachts.

Of late both these accomplished designers have been studying one another's models, and as a result "Valkyrie III" and "Defender" came out very much alike. The Americans abandoned the long, straight line of keel that was, perhaps, a survival of early prejudices, and considerably narrowed his beam. The Englishman widened his beam, probably as the result of his observations in American waters.

The American made many innovations in the matter of construction, using aluminum for deck beams and other parts of the frame, and resorting to many novel and ingenious devices to secure lightness and strength. The Englishman adhered to the main to traditional methods of composite framing, but introduced at least one novel feature, which will no doubt be adopted by other builders, namely, placing the keelsons some 10 inches below from the gunwale, so that less water remains on deck and less frictional resistance is offered when sailing with the keel awash.

When compared to their general sailing features the two yachts were so much alike that there was every prospect of the most exciting series of international races ever witnessed.

The official measurements of the two were:

MEASUREMENTS.	"Valkyrie."	"Defender."
Length on lead water line	100-00	100-00
Length from after end of main beam to forward point of measurement	100-00	100-00
Length from fore side of main to forward point of measurement	75-00	75-00
Length of spindles beam	10-00	10-00
Length of gaff	20-00	20-00
Length of boom	40-00	40-00
Height from upper side of main beam to highest lead block	100-00	100-00
Area of sail as per rule	1,100-00	1,100-00
Sail area, square feet	1,100-00	1,100-00
Beam length, per rule	100-00	100-00

"Valkyrie" allows "Defender" 10% allowance.

One noteworthy incident of "Defender's" anti-Brit was the shipment of an American crew, a matter which was attended with some difficulty since American sailors are not inclined to submit themselves to strict naval discipline, except in case of war. However, an excellent crew was shipped by agreeing to the provisions of Maine Seafarers, and after a few days of drill they fully justified Capt. Hall's expectations.

Mr. G. Oliver Iselin managed the "Defender" for the Regatta Committee of the New York Yacht Club, and it was thought that every precaution had been taken to guard against all possible mishaps or setbacks. In regard to the great bugbear of English yachtsmen, namely, the

presence of an uncontrollable fleet of excursion steamers, special measures were taken, and some at least of the English spectators declared that they could not see that one boat was more annoyed than the other.

The first race was sailed on Sept. 7. "Defender" won by eight minutes, twenty seconds. Upon the whole, the race was satisfactory, with a good sailing breeze and fair all-round conditions.

The second race was on Sept. 10. When the boats were making for the line an excursion boat lay in "Defender's" course. She avoided her, and, coming out near the line, was to the leeward of "Valkyrie," consequently having right of way. By a miscalculation "Valkyrie's" main boom struck "Defender's" rigging and carried away one of her topmast shrouds. "Defender" hoisted a protest flag, but continued the race and was beaten. Every effort was made to call the race "off" and resail it, but Lord Dunraven declined.

The third race was started Sept. 12 under what seemed extremely favorable conditions—a good breeze, a clear course, and the excursion fleet quite out of the way. After seeing "Defender" across the starting line, "Valkyrie" put about and returned to her anchorage. Lord Dunraven explained this action by saying that under the existing conditions (specifying the excursion fleet) he must decline to sail any more races.

This decision excited much indignation in America and some surprise in England, but nothing could be done, and Lord Dunraven sailed for home.

In a few weeks there appeared in "London Field" a letter from Dunraven specifically charging that after having been officially measured the "Defender" was secretly loaded with extra ballast, sinking her 4 inches deeper in the water than when she was measured.

As this was a direct charge of scoundrelism against the managers, it could not be ignored, and a meeting of the New York Yacht Club was called to take action. A committee was appointed, consisting of J. Pierpont Morgan, William C. Whitney, George L. Rives, Capt. A. T. Mahan, U. S. N., and the Hon. E. J. Phelps.

Lord Dunraven crossed the ocean, bringing with him distinguished legal counsel. The New York Yacht Club engaged Joseph H. Choate, of the New York bar. Lord Dunraven returned at once to England after giving his own testimony, in effect that to the best of his judgment, from ocular observation, the trim of the "De-

fender" was altered as charged by him in his letter to the "Field." Many witnesses were examined, including members of the crews of both yachts, and after careful consideration of all the evidence the committee made the following report:

"Upon a careful consideration of the whole case, the committee are unanimously of the opinion that the charge made by Lord Dunraven, and which has been the subject of this investigation, had its origin in mistake; that it is not only not sustained by evidence, but is completely disproved; and that all the circumstances indicated by him as giving rise to his suspicion are entirely and satisfactorily explained. They deem it, therefore, but just to Mr. Iselin and the gentlemen concerned with him, as well as to the officers and crew of the 'Defender,' that the committee should express emphatically their conviction that nothing whatever occurred in connection with the race in question that casts the least suspicion upon the integrity or propriety of their conduct. And the committee are not willing to doubt that if Lord Dunraven had remained present throughout the investigation, so as to have heard all the evidence that was introduced, he would of his own motion have withdrawn a charge that was so plainly founded upon mistake, and that has been so unfortunate in the publicity it has attained and the feeling to which it has given rise."

A courteous message was sent to Lord Dunraven, informing him of this conclusion and hinting that as a member of the club some personal recognition of this conclusion would be expected. None was forthcoming, although it was understood that his lordship's resignation was on the way. It did not arrive in time for the meeting of the club, and if it had the fact would probably have made no difference, as the club in its then temper would have refused to accept it.

The club therefore proceeded to pass a resolution, with only one dissenting vote, expelling Lord Dunraven from his honorary membership, on the ground that having made charges of dishonorable conduct against fellow-members, and having failed to prove them, he had also failed to make the only *amende* possible for a gentleman when he finds himself mistaken.

The yacht club acted throughout with the utmost courtesy and consideration for Lord Dunraven, and a number of the best English journals have admitted the practical justice of its verdict.

DEFENDER.

VALKYRIE III.

TO THE TWENTY VOLUMES, NEW SERIES, OF THE ANNUAL CYCLOPEDIA
1876 to 1895.

- VOL. XXXV.—49. A

- Russia, xi, 5; revolt, xi, 5; trans-Caspian railway, xi, 6; xii, 6; Ghilzal revolt, xii, 6; Russian occupation of Kerkil, xii, 7, 308; new ally for Russia, xii, 7; rebellion in, xvii, 2; Chitral expedition, xx, 4.
